So far 7 people have signed up for the TV NSP list. After Chrsitmas
I'd like to hold a get together. I'd like to discuss the last flight
and show its video. I'll also talk about the next launch and a
planned night launch for August.

Paul

2. Meeting?

From: Paul Verhage
Topic: 2 Message: 3

Would the TVNSP team like to get together over the holidays? I have the video to show.

Also, we need to pass the word around about subscribing to the listserv. There's only 7 people so far.

Paul

I'm thinking of holding a TVNSP meeting on Saturday, 30 Dec. Since we have people in Boise and Ontario, I'm thinking about holding it at the Idaho Pizza Co. in Caldwell. It would be scheduled for about 5:00 pm.

Would this work for everyone?

If so, please pass the word. I'll bring the new capsule and the video tape taken from the last flight.

Paul

From: Paul Verhage
Topic: 8 Message: 8

We'll plan for a lunch time get together on Saturday, 30 Dec. Location will be the Caldwell Idaho Pizza. The new nearcraft transmitted data over packet last night. I was able to get a fix on 5 GPS satellites through the ceiling of the apartment. The TNC does not start up in transparent mode, so the on-board electronics must send the TRANS command. I need to set up a proper relay for data, I think UFO helped me with that last time. Can anyone help me with that again?

More later, the school bell just rang

Paul

> More later, the school bell just rang

Class is out, thank goodness.

The next launch will carry a 35mm camera with IR film. I currently have a digital camera undergoing modification for computer control. If this can be accomplished, then the flight will also carry the digital camera. I also plan to test the pager on this next flight.

I'd like to carry a camcorder on a short flight (300 gram balloon) to record a landing.

I'm in the process of putting together a recruiting video. It will use video from previous flights. I have an estimate on color brochures which I'd like to hand out at future launches or libraries. I'm also planning to set up a display at the Mall in Boise. Woul;d anyone like to help me man it?

I am designing the TVNSP webpages at home. Once they are written, I need to find a website that will let me host them. Does anyone have any recommendations?

So, I'm keeping busy and hope to fly shortly.

Paul

Hello
I have been using the Palm software on my Palm IIIc. Have not used it to track a balloon yet,but i think it will work ok. The maps are not as good as a laptop setup, but for tracking on a budget and with limited space, i think they are sufficient.
The unit is nice to use when you do not have room for a laptop. There is a very nice terminal window which shows all data being received so you can get current lat./lon. readings from the transmitting balloon along with other data.
I use use the DB25 serial port on the back of my KPC+ to connect to the Palm.
I have a dedicated cable that alows me to plug into my Palm in a manner of seconds. I can be on the air transmitting / receiving data or messages in about two minutes.
You can try the program for free and see if you like it. It is very well written and easy to use. Dont know how well it will work on a Palm with only 2mb of memory. Probably pretty slow. I have 8mb and the maps load quite quickly on my unit.
One side note,my color Palm is nice, but it is hard to see in bright sunlight. If you have a black and white Palm, i think the maps will be much easier to see. Have the same problem with a color screen on my laptop also.
Anyway, i am very happy with the program. My $.02 worth

Hi Paul and all,

I have purchased a laptop computer through ebay. It is a Pentium 133 with 24MB of memory and a 750MB Hard drive. It should arrive this week. It comes with windows 3.11. I will gladly load it with the prediction software and bring it to the next meeting to help out. All I need is instructions. Where do I get the software and what data do I download to bring to the meeting? Will windows 3.11 be okay or do I have to upgrade it? Also I will need help on setting it up to track the balloons. Which TNC do I need. What software? Do I need a GPS if I'm just tracking? I have an Alinco DJ-162 handheld. Will that work for the receiver? Any help is appreciated.

Thanks,
Jeff

Congrats on the laptop.
For the balloon tracking program, go to www.eoss.org Then select their balloon software page. I don't know if it will run under 3.11, I'll take a peek and see. As for a TNC, anyone should work. I use the KPC3. It's made by Kantronics out of Kansas. I need to set up my laptop for APRS, also. Perhaps we ought to have a meeting over that specifically.

How about it?
Anyone interested in having the Feb meeting about setting up APRS? I think we'll need the help of Randy and Doug.

Paul

Hi Paul, Jeff and Everyone

I can bring my laptop with APRS+SA and demonstrate it if anyone would be interested. I used to have WinAPRS loaded, but due to limited hard drive space i deleted it.
I know Doug and several of the other Boise hams use winAPRS so they should be able to help there. I can bring my portable tracker setup if anyone would like to see a good mobile setup. Also it would be nice to see someone bring a Kenwood D700 and TH-D7A with built in tnc's.

Jeff, you will not need a gps to track the balloon. All you will need is a radio and tnc hooked to the laptop. Maybe after you see the different software,radio,laptop and tnc's combo's you can make a good decision to fit your needs.

Might make for a long meeting, but sounds like fun. Go for it.

(Phone: 61-8-8952-6315)

RELEASE: 01-03

NASA BALLOON RESEARCH RIDES TO THE EDGE OF SPACE

The countdown is underway for the launch of a revolutionary research-balloon designed to fly higher and longer than anything before it, and the flight could open a new era in scientific research.

NASA's new Ultra-Long Duration Balloon (ULDB) is scheduled to lift off Jan. 16 from Alice Springs, Australia, and will carry the hopes of many scientists who see balloon technology as an economical means of studying the Earth and space.

"Although balloons have been flying for more than 200 years and scientists have long used them for a variety of research missions, the length of time balloons can stay aloft has always constrained their efforts," said Steve Smith, Chief of the Balloon Program Office, NASA Goddard Space Flight Center's Wallops Flight Facility, Wallops Island, VA. "Thanks to greatly enhanced computer technologies, high-tech materials and advanced designs, longer-range balloons are poised to open a new frontier for high-altitude research".

The balloon is expected to float over the Southern Hemisphere at an altitude of approximately 115,000 feet (35 kilometers),

3 to 4 times higher than passenger planes. While the test flight is expected to last only about two weeks and circumnavigate the globe, the ULDB is designed to support missions for up to 100 days.

"Balloons provide cost-effective platforms for near-space observations," said Dr. Vernon Jones, Office of Space Science, NASA Headquarters, Washington, DC. "This January flight provides an excellent opportunity to test the newly designed ULDB system."

The full-scale ULDB is the largest single-cell, super-pressure (fully sealed) balloon ever flown. At launch, the balloon is partially inflated with helium and expands as it rises. When fully inflated, the massive ULDB would barely fit inside a domed football stadium.The ULDB floats above 99 percent of the Earth's atmosphere and can carry a 3,500-pound (1.588-kilogram) payload. The balloon system comes down in a controlled descent. It may be visible from the ground with a telescope and, in some cases, with the naked eye.

The ULDB's unique pumpkin-shaped design and its novel material, a lightweight polyethylene film about the thickness of ordinary plastic food-wrap, were successfully tested during a prototype flight from Ft. Sumner, NM, last June.

"Recent development of new balloon materials and associated technologies will enable challenging, important investigations to be done at relatively modest cost," said Jones. He added that the ability to fly balloons for months or years at a time would create a multitude of scientific and business opportunities.

Conventional high-altitude, scientific balloon flights typically last a few days to a week because temperature changes from day to night ultimately cause the balloon to lose altitude. The ULDB is completely sealed, so gas is not vented to relieve pressure. The new super-pressure balloon will maintain lift, size and shape, and will not lose significant altitude due to atmospheric influences.

Future science missions for the ULDB will study the source of cosmic rays generated from shock waves emanating from supernovae and will perform surveys of X-ray emiting objects in the universe, search for planets around other nearby stars and will study other objects in space, including the Sun.

The Wallops Flight Facility manages NASA's scientific balloon program for the Office of Space Science. Launch operations are conducted by the National Scientific Balloon Facility, Palestine, TX, which is managed for NASA by the Physical Sciences Laboratory of New Mexico State University, Las

Cruces. Australian operational support to NASA is provided by
the Commonwealth Scientific Industrial Research Organization.

More information on the Ultra-Long Duration Balloon mission
and tracking of the balloon flight can be found at:

http://www.wff.nasa.gov/pages/scientificballoons.html

Maybe they could share some ot the funds with us. Looks like they spare no expense for good stuff. Noticed the huge truck with helium.

BTW,what is the tube trailing off the side of their baloon? Is that some sort of stabilizer or a venting tube or something. Inquiring minds would like to know?

I'm looking for a Sony camcorder with video in and video out. Apparently many of the Sony's can use their video out port to also bring video in for recording on the camcorder's tape deck. If you have one you would like to sell, or know where I can pick up a used one, please let me know.

27. Meeting

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-01-20 22:18:33 UTC
From: Lloyd Verhage
Topic: 23 Message: 27

Thanks for attending the meeting. I know the roads weren't in the best condition. The next meeting will be planned for late Febuary. Either Saturday the 17th or 24th. The topic will be APRS. So bring your laptop, TNC, and radio. I'll bring a capsule so you can capture data from it.

The March meeting will be earlier in the month. Jeff suggested we attend a NWS balloon launch, which I think is a capital idea. So the March meeting will take place at around 6:00 pm on a Saturday so we can see a launch. Afterwards, or before, we'll meet for dinner to discuss balloon launching procedures for TVNSP.

I brought up the idea on making these meetings a more formal group. We could meet once a month. During the off season we can learn or review procedures. during the balloon season we will continue to meet, but only on the day before a launch. Those meetings will familiarize everyone with the planned capsule and mission.

One other idea for the group is to help each other develop their own balloon capsules. By this summer I will have a new design for a balloon controller. If you are interested in building your opwn balloon capsule, I will make a bare board for you. You'll need to get a GPS, radio, servo controller, and HT. At some point we'll hold a soldering party and get the electronics built.

Another benefit of the group is that it can look for funds or donations. Indiviuals with their own balloon capsules would get a share of the donations to help them fly their capsule. On future flights we could carry two capsules from two different people on a balloon flight. There's no reason why both capsules have to belong to the same person.

I'll looking for a name for this group. Perhaps Idaho Near-Space Group (ING). Please share your suggestions.

Thanks,
Paul

28. Feb Meeting

There might be a problem for the 24th, as we have a testing session in Fruitland the fourth Saturday of every month (the 24th of February) from 9:00 am to noon. This might not affect anyone but VE's, but you should know about it.

73,
Jim

Date: 2001-02-02 14:32:42 UTC
From: Paul Verhage
Topic: 28 Message: 32

By popular demand, the next meeting of the TVNSP will be noon, Saturday, 17 Feb. Meet at the Idaho Pizza Co in Caldwell, located on Nampa-Caldwell Blvd. The topic will be setting up and operating APRS. In past meetings Randy and Doug said they could help out. I need to confirm that's still the case. I have APRS loaded on my laptop. I now will arrange to get power to my TNC and my HT connected. Bring a PC or laptop. Doug or Randy, if you need any photocopying, email it to me and I'll take care of it.

The March meeting will discuss launching balloons and will watch the NWS launch one of their's. This meeting will proably be a dinner meeting, since NWS balloons are launched at 5 and 6, depending on the time of year. Of course we could make it a breakfast meeting if you want to arrive at the NWS before 5 AM. ;)

Paul

I should be able to make the meeting with my laptop, radio and tnc.
Anyone else with APRS stuff should bring them for show and tell.
Will have some handouts. Paul, I may send you some screen shots to make
transparencies for me. I will try to get it done at work if i have time.
Yikes,i thought 5 or 6 meant PM.....<;)

BTW, Pat and I figured out how to import the predicted balloon path onto Street
Atlas. Really cool.
You can also predict the best laucnh site from Balloon Track, Pat discovered.

Fantastic. I'll have my laptop and TNC there. Right now the TNC is talking to a PC running Terminal, but it does stop after a while. I'll check the battery voltage.

Paul

36. Feb 17 Meeting

From: Paul Verhage
Topic: 36 Message: 36

There is a birthday party at Idaho Pizza on the same day. As a consequence, the TVNSP meeting will begin an hour earlier. So for Febuary, we will begin the meeting at 11:00 am, rather than noon proper.

Astronomy Day will be in late April. I think I will try to move the second flight to Astronomy Day and have a tracking station setup in the Discovery Center. More on the 17th.

Paul

37. KPC2

I plan to use a KPC2 for my tracker. Unfortunately, I have no instructions or other documentation. Does anyone how how many volts this sucker expects in its power jack? I've tried 9 volts, but the KPC2 dies after a while (stops responding to the PC). I assume this occurs because the voltage in the battery drops too low.

Thanks for any help,
Paul

Paul

Most tnc's i have used take 12 volts . I have never had any luck running them off 9 volts for very long. Generally the 9 volt battery option is for portable operation. You are supposed to put the tnc in low voltage mode by disabling the led lights via internal jumpers. I dont like this mode because i like to see how the tnc is operating. I just hook mine up to a 12 volt battery and it runs for ever.
Anyway that is how my PK-12's and KPC3+'s work. Maybe contact Kantronics to verify the voltage before you let out the blue smoke on this older model <:)

You may also post to the national APRS SIG at aprssig@... or the Northwest APRS SIG at nwaprssig@... for expert advise. Someone there would probably have a manual for you or tell you how to find one.

Hi Paul,

I think you may have problems with that KPC2. I would recommend a KPC3
or KPC3+. These both will run on just about anything 9 volts or over.
Anyone know any different.

Stephanie

41. KPC2, the next question

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-02-06 14:27:10 UTC
From: Paul Verhage
Topic: 41 Message: 41

I connected my KPC2 to a car battery and it works fine. But now I need to know how to wire up the HT. My HT is an Alinco DJ-F1T, which is not documented in my KPC3 book. The first thing I noticed is that the ear and mic jacks are not labeled on the HT. I assumed it was similiar to a Yaesu HT and tried that arrangement. All it manages to do is key the radio, even if the TNC is turned off. So next I dug through my collection of stuff and found the old mandheld mike for my radio. The smaller 2.5 mm jack is a three conductor (has two dark bands) and the larger 3.5 mm jack is a two conductor (has one dark band). This makes me wonder if I should treat my Alinco as an ICOM 2AT, but with the jacks switched around.

Has anyone worked with the Alinco?

Finally, there's some concern the KPC2 will not work as a tracker. Does anyone have any experience using the KPC2 with APRS+SA? I want to make sure I'm not wasting my time here.

Thanks,
Paul

42. KPC2

From: Doug Rich
Topic: 37 Message: 42

I have a KPC2 and a manual. The specifications for the kpc2 says the power requirements are 9vdc to 14vdc < 250 ma (will not take long to drain a 9vdc battery).

I also have a kpc3 and a 3+. They only require 6vdc to 25vdc < 40ma and if low power options are in place the current is reduced to < 15ma. (will last about a week or more on a 9vdc battery).

The KPC2 would not work as a tracker because there are no commands in the software to deal with GPS information. It works great as a fixed base APRS TNC and it is the one I use at my house.

Doug is right Paul. It will work ok for a base station or as a monitor in your mobile for tracking a balloon. You just will not be able to send out your position automatically as a tracker with a gps attached as you travel. No one really needs to know where you are at anyway. <:)
The balloon is all we care about...hi.

If you want to follow the balloon only, it should be ok. It should work with WinAPRS , APRS+SA or any other aprs software. If you want to be a full blown Stand-alone-tracker then you should get a newer TNC or one of the newer Kenwood radios with a built in tnc.

Well, I have great news, my TNC is talking to my radio. I'll test reception tonight. Randy, at the last meeting you said you had a file I would need if I were to use the KPC2. I didn't make a copy at the meeting. Can you email me a copy?

By this weekend I will test my laptop with the TNC and HT. I think I'll have a balloon tracker by the meeting. I'll just need to finalize settings.

Don't forget, the meeting on the 17th begins one hour earlier.

I am asking the Idaho Space Grant Consortium for money for the August launch.

Paul

Doug

Paul needs the tnc file that has the commands that start the tnc communicating with APRS.
The commands should be similar to the attached file i am sending. If yours KPC2 works fine just verify the commands you use in your tnc when it starts up in winAPRS. Hope this makes sense.

I rebuilt my TNC cable, it's now durable. The KPC2 is displaying data from the near space capsule in a windows terminal program. On my laptop is a copy of APRS (unregistered) and Street Atlas 4. I also extracted some more maps for SA4. Tonight I'll connect the KPC2 and laptop together. I'll try APRS and hyperterminal. Right now I just want to see that I can get data from the capsule and display it on the laptop. I have a Tripmate GPS that I got with SA4. I plan to get a second comm port (PC card) to run the TNC and GPS at the same time. Any suggestions would be helpful.

Can I send a posit using the KPC2? It sounds like the KPC2 will not handle GPS data automatically, so I'm wondering if I can force the laptop to send a posit every couple of minutes, instead.

Will anyone else be bringing a PC or laptop to the next meeting?

Paul

I can send you info on how to make a device that will switch the pc comm
port between two devices. You can build it into a db 9 or 25 hood.

Please do!
I'll get started on it right away. I figure it will be cheaper than
purchasing a second comm port.

Paul

I have a HSP cable from AEA (now defunct) that will alow you to share two devices on one com port.
I bought it along time ago, but did not like the way it worked. Seemed to miss to much data with it. I will let you have it, since i don't need it. I opted for a second serial card to make things work easier.

I dont think the tnc will send the gps data automatically. You can use the software to manually send lat/lons. Kind of clunky but a viable option.

I plan on bringing a laptop and one or two of my aprs setups.

I'll try the HSP, but may eventaully go to a second comm port. I'm afraid of waht it will cost me :)

The KPC2 was affordable, so I went that way. At least a clunky setting is cheaper than a better quality TNC.

Hi All,

I received my new KPC 3 Plus yesterday. Today I put it together and WOW! It actually works! I've got a lot to learn so I'm really looking forward to the class. I understand that we are supposed to meet at 11:00 because of a birthday party at 12:00. Will one hour be enough time? Any thoughts on that?

Anyway my setup is this so far. I have a handheld Alinco DJ-162. I hooked up the speaker output to the KPC 3 but not the mic. I'm not sure how to hook up the mic yet but that can come later. At least I can track the balloon. For software I am using APRS Plus and Delorme Street Atlas. The same software as Randy. My next step is to clean up cables and figure out how to make it all portable. The power is the main consideration. The battery in the radio is deceased so I have to plug it in with a 110 VAC power adapter (not very portable anymore). I am running the KPC 3 from a small bench top power supply but I could get 12 volts from the truck. Of course my computer needs 110 VAC. I have purchased a Tripp Lite PowerVerter model PV200 that I plan to install in my truck. That should provide all the power I need for the laptop and the radio.

Anyway it looks like I'll have a setup ready for the meeting.

We'll have two hours, the party starts at 1:00.

Sounds like your tracker is at the same state mine is at, Jeff.

Randy,

After last night's TVRA meeting, I brought up the web site to download Balloon Tracker, but I surfed that site for an hour, and could not find a link to download anything, let alone Balloon Tracker. Clicking on "Balloon Tracker" simpy sent me to a site that glorified all the attributes of the program, but brought me no nearer to downloading. A line at the end of the site said "Last revised Feb. 7, 2001" (day before yesterday). I must be about two days late (and $2.00 short?)" You think he is going into business, or do I need my glasses cleaned?

73,
Jim

Rick updated Balloon Track a couple days ago. Apparently the website hasn't been updated with this new version. I proably still have a copy of the previous version. Come to Feb's TVNSP meeting and I'll bring a copy (assuming you can't get a copy before then).

Paul

62. Meeting

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-02-15 14:38:35 UTC
From: Paul Verhage
Topic: 23 Message: 62

Don't forget the meeting this Saturday. Also remember the meeting will start an hour earlier, at 11:00 am. Bring your laptop/PC and a copy of APRS.

For the second flight of the year, I plan to fly slow scan. The flight will be launched on 28 Apr, Astronopmy Day. We'll need someone to operate a Station at the Discovery Center. This mission control will need to record and display APRS, SSTV, and chase communications. More at the Feb meeting.

The March meeting will be eariler in the month. It will be a dinner meeting so we can visit the National Weather Servive at the airport. Also, we may be able to launch from their facilities. After the liability issue is looked at, I'll know for sure.

Paul

64. Status, 17 Feb

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-02-18 00:31:31 UTC
From: Paul Verhage
Topic: 64 Message: 64

It was a very nice meeting, thanks everyone for attending. Two of us need to purchase a new copy of APRS. There is a discount if we order five copies. Each copy is $30 then (I'll double check this cost). Are there three others interested in purchasing a copy of APRS?

The next meeting will be Mar 10 or 17th. This will be an evening meeting so we can watch the National Weather Service launch a balloon. The meeting will then discuss our balloon launching technique.

The next balloon launch is scheduled for Mar 24th. The date and location have yet to be determined.

Paul

Anybody interested in winning a free GPS? Go to
http://www.GPSdiscount.com and click on GPS Giveaway. It is a Garmin etrex.
If you win you can choose between the GPS or $114 gift certificate to use
toward another GPS.
I checked prices on the Garmin III Plus and it sells for about $289. The
Garmin emap sells for about $189 and has similiar features. Any comments on
the emap? Likes or dislikes?

Jeff

The eMap gps looks like a very fine entry level a map display unit from Garmin.

In the long run it will cost a little more if you decide to upgrade. The eMap does not come with a pc cable ($33) like the III+ does. You will require the 8 Meg Memory Cartridge ($99) to increase map detail. Also if you want to add an exteior antenna the eMap will require a MCX to BNC adapter ($25). I do not see much need for an external antenna with a 12 parellel channel receiver. Do the math and it adds up to over $300 to get the same features and hardware equivalent to the III+.

I would go to a store and play with each one to compare features.. The III+ was a little tricky to learn with all of its menus and features. It is a large investment so get the one that fits your needs now and in the future. Those seem to be very good prices compared to what i paid for my III+. I priced the accessories from my Cabela's catalog. They want $198 for the eMap.

Make sure the website is very reputable if you buy there. There have been some fly-by-nite dot coms selling gps's for unreal low prices.

My 2 bits worth

74. APRS

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-02-19 22:33:25 UTC
From: Paul Verhage
Topic: 74 Message: 74

I've updated the TVNSP webpage with information on setting up APRS for tracking. Please take a look. If I've missed something, please email me.

It looks like INITKAM works for initializing the KPC2.

Paul

75. Meeting and TV01A and TV01B

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-02-26 21:15:22 UTC
From: Paul Verhage
Topic: 75 Message: 75

I'm trying to schedule the nxt meeting for 10 March. This one will first meet at the National Weather Service (NWS) to observe a radiosonde launch. Afterwards we'll head some place for a dinner meeting and discussion of how to launch the TVNSP balloon.

TV01A is scheduled for Saturday, 24 March. The balloon will be a 600 gram balloon filled with 2 to 3 pounds positive lift (PPL). The max altitude will be around 70,000 feet and the ascenty rate should be around 1000 feet per minute. Use those numbers when making predictions for the flight.

TV01B is scheduled for Saturday, 28 April. This is Astronomy Day and the Hamfest in Caldwell. I'd like to get stations set up at the Hamfest and the Discovery Center (DCI). DCI will be mission control for the flight. To operate mission control, we need to mount an antenna outside and have PCs inside. Its a 20 foot cable run from the PCs to the antenna.

I need to line up volunteers for both sites while still having enough crews to launch. Would anyone who wants to volunteer for the Hamfest be willing to help launch and then go to the Hamfest? DCI opens at 10:00 am. I figure we can launch as late as 9:30. At DCI I would like to track the balloon with APRS, capture images with SSTV, and monitor voice communications with the chase crew.

Please let me know what you can volunteer for.

Paul

No one has volunteered for any position yet. It will depend on the winds as to where we launch from. I expect we will launch from either Jordan Valley, Murphy, or Boise.

Paul
I can help with the chase. If you get no volunteers for DCI, i can drop back after launch and helpout. Let me know your plans after you get more responses.

It looks like we're set up to observe a radiosonde launch this Saturday. We need to be at the NWS gate at 3:00 pm. To get to the NWS, take I-84 and exit on Vista. Head towards the airport, but at the light, turn left. This will take you in front of the Copper Kettle, an eatery. Just past the Copper Kettle, turn right and head towards the Nation Fire Center, they have their logo painted on the building. You'll run smack dab into a locked gate. This is the gate that we meet at.

After the launch I'd like to hold our March meeting. Does the Copper Kettle sound good?

Paul

Paul-

I take it that this is in Boise. Do you know what sonde program they use?
Is it the one from Vaisala?
We use the Vaisala RS80 sondes and a program from a Professor at the U of
Wyoming. The freq is 402.400 +/- (it drifts with temp & voltage change),
wide FM. I use a KAM Plus to pick up the signals. Ours uses the t-max
board to add telemetry inputs from external sensors.

Hope you have a good launch.

From: Paul Verhage
Topic: 84 Message: 84

When we order APRS, all we'll get is the secret code to unlock the software. We have ten people interested in purchasing a copy right now. So I'm ready to order. The copies will $30 each. I will not cash your check until after I recieve the secret code for APRS.

If you still want to register your copy, send a $30 check and SASE to me at:
TVNSP
207 Crestline #3
Caldwell, ID 83605

Make the check out to Lloyd Paul Verhage, but please use TVNSP on the address so I knwo what the letter is for.

Thanks,
Paul

> You know me, I'm there and I might bring a friend if that's alright.

That will be alright. The NWS has asked me to provide a list of names.
What's your friends name?

Paul

91. Weather Service Launch

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-03-08 14:19:38 UTC
From: Paul Verhage
Topic: 91 Message: 91

The NWS has asked me for a list of names of the people who will attend the launch. Please email me ASAP if you plan to attend. So far it's Justin and Randy, with John a possible. Any more? Don't forget, there will be a meeting afterwards about the launch on 24 March.

I picked up a camcorder ysterday that I had modified for computer control. The modifications will allow the capsule to turn the camcorder on and off, along with controling it to record either through it's camera lens or from an external source.

Paul

93. August Flight

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-03-09 18:59:29 UTC
From: Paul Verhage
Topic: 93 Message: 93

It looks like I have the money from the Idaho Space Grant for an August flight to record meteors from 100,000 feet. I've scheduled the launch with CSI and their star party that night. Right now I need to get an idea of how many people could drive to CSI on the afternoon of 11 august to help out with the launch and recovery. I'll also send email to the Twin Falls radio club.

Paul

If I'm not busy working or being lazy, I'll be there. I went to CSI a few weeks ago to check out the campus.

Thanks for the offers of help for the August flight. I'll need as much as I can get.

I still need help for the April 28 flight. So far Randy has said he could help man the mission control, after the balloon is launched. Can anyone else help with operating mission control at DCI? Mission Control will monitor the flight through APRS and display SSTV as it comes in. I'd also like them to provide assistance to the chase crews via the repeater.

So far I have checks from KC7JSD, WE7U, WM7W, Prada, and N7SI. We have enough people to order APRS now. I'll wait another week for anyone elase who would like to get a copy.

Paul

I don't know about the edition, but look at the publication date or the copyright date. If it is after April 15 of last year, it is OK. That was when the licensing structure changed. The main change in the question pool was to consolidate the novice and the technician questions. So if you have an older book, you would have to find an old novice book to supplement the old tech manual. Hope this is some help.

73,
Jim

110. RE: [tvnsp] Balloon Flights

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-03-12 20:07:47 UTC
From: Paul Verhage
Topic: 104 Message: 110

I didn't see the previous emails. Thanks for running mission control for us. The plan is to set up the equipment the night before. The launch will be held off as late as possible, as DCI doesn't open until 10:00. This weekend we decided to launch from the hamfest, winds permitting. I'm planning for mission control to open up at 9:30. We need to set up a radio for voice, APRS, and SSTV. That also means we'll need two PCs.

Paul

111. Launches

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-03-13 14:27:49 UTC
From: Paul Verhage
Topic: 111 Message: 111

The next launch is on 24 March. It will use a 600 gram balloon and should make around 70,000 feet. I'd like to launch from the Homedale Airport. For prediction purposes, use a max altitude of 70,000 feet, ascent rate of 1000 feet per minute, and descent rate of 1200 feet per minute.

I'm starting the checklist. I'd like to develop this collabratively, over email. Please add to it. I'll email out something later this morning.

The plan is to launch the second flight from the hamfest and maintain mission control (MC) at the Discover Center (DCI). MC will be set up the night before and will need a radio for voice, and a PC or two for APRS and SSTV. That means we need two more radios. Can anyone help with lending the equipment? Doug has volunteered to man MC, can anyone else help him? Launch time will be 9:30 or 10:00, winds permitting. We need to be at DCI by say 9:00, to get everything up and running.

Paul

Is it the Homedale airport or the Marsing airport?

114. Checklist

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-03-13 22:39:04 UTC
From: Paul Verhage
Topic: 114 Message: 114

Here's a preliminary checklist. I'll be adding more to it. Please add your own comments.

Paul
++++++++++++++++

Before beginning the filling, perform steps 1 to 4

1. Check battery voltages
2. Install batteries
3. Power up test, do we have GPS lock and packet transmission?
4. Power down capsule

If the telemetry capsule checks out, then begin filling the balloon

Final capsule assembly occurs concurrently with balloon filling and parachute prep

FINAL AASEMBLY
Stack capsules
Connect the link lines
Connect umbilical (if needed)

PARACHUTE
This takes 2 or 3 people
Unpack the recovery parachute
Disconnect shroud lines and untwist them
Reconnect shroud lines to parachute
Confirm shoud lines are completely linked
Connect shroud lines to top capsule
Confirm there are no twists in shroud line connections to capsule
Keep parachute off the ground

BALLOON
Check ground for sharp objects
Layout ground cloth
Check ground cloth for debris
Clear area of obstacles/objects that may make contact with balloon
Don cotton gloves
Lay out balloon
Untwist balloon
Roll tank near balloon, tank must lie down
Screw in regulator/filler
Insert filler and tape to nozzle
Give verbal warning, balloon filling begin
Keep two people with balloon (watch your heads)
Crack tank, slowly filling balloon

Watch that balloon is not twisted
Once balloon begins to rise, open tanks further

We may want the checklist to start with an inventory of required material for the launch. Perhaps this would be a separate checklist for whoever is bringing the material to the launch. Some examples are:
1) Peanuts (not to eat, but to pack in the capsule. Or maybe both!)
2) Blanket to lay out the balloon.
3) Duct tape.
Sometimes it's to easy to forget that one item you really need for the launch. It's kind of like going camping and forgeting the matches. How much detail do we want? Do we just want to stick to the launch checklist or make both? Comments?

Hi all,

Anybody running the prediction program? I ran the balloon track program and imported the file into Street Atlas. If the balloon were launched now it would end up directly over Boise Airport at about 38,000 feet traveling 109 MPH. Anybody get the same results? The landing site would be 2 miles SW of Pine Airport.

117. Tracking Station

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-03-14 05:01:06 UTC
From: Jeff Melanson
Topic: 117 Message: 117

Hi all,

Here's a strange one: When I run my APRS tracking gear on the bench it works fine. It constists of a laptop, a KPC3, and an alinco DJ162 radio. When I place it in my truck I have a problem. The recieve light on the TNC stays on unless I rev the engine up to 2500 RPM. I'm using the cigeratte lighter plug to power the TNC, the radio, and the inverter that runs the laptop. Could noise on the power line cause this? I don't know if these next two things mean anything but here it is: If I turn off the inverter then I don't have to rev the engeine as much. If I unplug the speaker output of the radio to the TNC then the recieve light goes out. The radio is still squelched. On the bench I use a 12 volt power supply for the TNC and radio and plug the laptop into the 110 volt outlet. The TNC should run on 9 volts so it would be hard to imagine that any minor voltage changes would cause this. Any thoughts on this?

Let's also create a "to bring" list. I'll start one during my prep period
and email it out.

Paul

120. Camcorder

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-03-14 14:31:47 UTC
From: Paul Verhage
Topic: 120 Message: 120

I've completed the wiring of a camcorder for computer control. It's a Sony 8mm with video in and video out capability. A service tech replaced the switches with wires. I then connected the wires to transistor switches (2N3904) with a current limiting resistor on their bases. I can control five functions of the camcorder, including turning it on and off.

TVNSP will attempt to fly the camcorder on its next flight, March 24. The camcorder will be instructed to power up at 60,000 feet, or during descent if the balloon bursts early. With two hours of tape, this should record the landing (I gotta try to beat Mark at this).

If anyone is interested, let me know, I'll email you more info.

Paul

I think the projected landing point is really interesting. I don't know if it would help in the chase on a real flight but knowing the normal projected landing points might give some outside parameters anyway. OK maybe I just think its interesting stuff....

126. RE: [tvnsp] Re: Launches

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-03-17 05:18:25 UTC
From: John Knapp
Topic: 111 Message: 126

Can you convert the location to decimal instead of minutes and seconds.

Thanks

JohnK

127. RE: [tvnsp] Re: Launches

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-03-17 14:33:41 UTC
From: Doug Rich
Topic: 111 Message: 127

43d 36' 55" -116d 55' 19" Divide the minutes by 60 to get the decimal
value. 55/60=92 19/60=32 So it would be 43d 36.92' -116d 55.32'.
I am no math major, but I think this is right.

Doug

128. Re: [tvnsp] Re: Launches

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-03-17 15:09:12 UTC
From: Randy Farley
Topic: 111 Message: 128

I came up with 43.61431 and 116.92419
BTW if anyone use APRS+ and Street Atlas, there is a nice conversion program in aprs+ that converts lat/lons to different formats.
It is in the "Commands" tab, then "Coordinate Conversions" menu

Randy, is that number fractions of degrees only? That is not degree and
min., correct?
As I look back, you are right in that John wanted only degrees.

From: Jeff Melanson
Topic: 111 Message: 130

Hi All,
I used Street Atlas and the coordinates in decimal is;
43.614700, -116.922700
This is the format used by the Balloon Track program.

Jeff Melanson
KD7INN

131. RE: [tvnsp] Re: Launches

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-03-17 16:53:15 UTC
From: John Knapp
Topic: 111 Message: 131

Thanks. For this morning I came up with a landing site of 42.7914 lat
and -115.1309 long. Flight time of 96 minutes and range of 75.9 mi. How does
this compare with some one else?

Thanks
JohnK

132. Re: [tvnsp] Re: Launches

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-03-17 17:48:20 UTC
From: Jeff Melanson
Topic: 111 Message: 132

John,
Here's the numbers I used.
Homdale Airport lat 43.6147, lon -116.9227, Altitude 2210
Burst Altitude 70,000 ft
Ascent rate 1000
Descent rate 1200
It looks like the landing area altitude is around 2800 ft so I plugged that number in.

This placed the landing site SouthWest of Bruneau by about 4 miles.
lat 42.8403 lon -115.8556
Range 75.8 miles
Flight time 97 minutes

Your landing is about 37 miles east of mine.What data did you use?

133. Re: [tvnsp] Re: Launches

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-03-17 18:01:48 UTC
From: Jeff Melanson
Topic: 111 Message: 133

One additional note:

Using Street Atlas to plan a route from Homedale to the landing site shows the trip time is 2 hours 17 minutes. Flight time is 97 minutes. The Balloon will travel 76 miles. We will travel 91 miles.

134. RE: [tvnsp] Re: Launches

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-03-17 18:21:11 UTC
From: John Knapp
Topic: 111 Message: 134

I believe my starting point is off. I used 43.5671 lat and -116.1988 long. (Boise airport??) I haven't plugged in the latest lat and long yet. Ascent rate was 1000 fpm, descent rate was 1200 fpm, launch altitude of 2500ft. The landing altitude was 4000 feet. That may be my problem. When I have a chance (this evening probably) I will adjust and go from there. Thanks for the help.

JohnK

To unsubscribe from this group, send an email to:
tvnsp-unsubscribe@egroups.com

Your use of Yahoo! Groups is subject to http://docs.yahoo.com/info/terms/

136. RE: [tvnsp] Re: Launches

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-03-17 18:36:13 UTC
From: John Knapp
Topic: 111 Message: 136

I redid my estimate and came up with the following:

Launch site: 43.6147, -116.9227 alt. 2210

Landing: 42.8406, -115.856 using altitude of 2500.

JohnK

What!!
Do you mean to tell me that we can't keep up with a rubber balloon!?

Just wait until the balloon passes through the jet stream!

If launched today, the balloon would recovery east of Fruitland. The balloon would travel 23 miles, not too bad. The 6.5 day medium range forecast (MRF) shows winds aloft from the south. If that holds up, we'll need to launch farther south to keep out of the mountains.

The camcorder frame has been completed. I'll make an interface cable (1 hour) and update the flight program (1 hour) tonight.

In the last 24 hours, I've have people come up to me asking about near space. Perhaps this will lead to two new members.

I'll pick up tanks of helium on Friday after work. I'd like to get together with everyone Friday evening to discuss the flight. I'll put together more of a checklist and email it.

I just remembered. I just found out we got money from the Idaho Space Grant Consortium for the August flight. The Boise Astronomical Society has donated the other half. The money pays for a 3000 gram balloon and three tanks of helium.

My cell phone battery has died. No one makes batteries for the old NECs anymore, so I've changed my cell phone service. I'll email out the new number as soon as I learn it, myself.

What info were you using for the launch site? Jeff, John K and I
all have the landing site SW of Bruno Dunes using 3/17 12Z data from
BOI. It will be interesting to see how the winds aloft change during
the week and effect the landing site location.

>I'll pick up tanks of helium on Friday after work. I'd like to get

You were wanting to make sure that we still had daylight for the
Friday evening briefing. The sunsets at 7:03p so if we meet at 6:00p
there should be plenty of time. Also, the sunrise for 3/24 is at
6:42a so if we have relatively clear skys it should be light by 6:15.
Sunrise/Sunset tables and twilight data is available at:
http://aa.usno.navy.mil/data/

Using data from 1200Z 17 Mar 01 I got the following:

I came up with a landing site of:

42.8435 lat and -115.8592 long.

If I did the conversion correctly, it looks like the balloon would land about 4.3 miles South West of Bruneau. Range of 75.5 Miles and Flight time of 100 Minutes.

Does this sound about right??

I seemed to have lost me notes on the Web Site where I can get the future forcasts, cna some one send the URL to me?

Also, someone was looking for MSDOS 6.2. I found a copy but can't remember how wanted it. Let me know, I will try to get it to you.

I used the Homedale Airport as the launch site, but Saturday morning's winds. To look up the landing site, I went to Mapblast.

That settles it then, the Friday meeting is that the Caldwell Idaho Pizza Company at 6:00 pm. I'll make reservations today. Let's start filling at 5:30, with a planned launch at 6:30. Keep watching the weather report.

The capsules are assembled and stacked. The software was written last night and tested this morning. I ran into a problem that took 30 minutes to figure and 30 seconds to correct. If the camcord is put on Standby, it doesn't respond to commands from the flight computer. I'll pick up a 9V battery today. That should be the last tiem needed before launch. I'll make up a new flight battery later in the week. Testing is using an older battery. There are three Remove Before Flight tags on the capsules. One for the beacon, one for the IR camera lens and the last for the camcorder.

Paul,
I couldn't get any of the data to indicate a landing near Fruitland. It all indicates a flight going East or Southeast of Homedale. How did you do it?

If launched with this mornings winds, the capsule would recover 2 miles past exit 99 on I-84. This puts it a few miles southeast of Mt. Home. I think it would be an acceptable place to recover.

Doug is running into problems with his tracker. Who else is planning to bring a tracker? My setup won't be ready by Saturday. Although I plan to bring my doppler. If I carry the tanks, I will only have room for one passenger. I'll need someone with a radio to ride shotgun. Volunteers?

We'll use the 25 repeater for the chase. We'll go to 146.52 simplex if we drop into a valley.

My cell phone has died. I'm the process of getting a new service, once I do, I'll pass my number along. In the meanwhile, here are two other numbers for TVNSP (and BOI). The phone number to the Boise flight tower is 334-1642. To file a NOTAMS, call 383-3110. NOTAMS should also have a toll-free number. As soon as I find it, I'll pass it along.

I called Boise and NOTAMS a few minutes ago, notifying them of the launch. I'll bring my working cell phone with me on Saturday. after the launch we want to give them another call.

Depending on winds we may move the launch site. we'll make that determination on Friday at dinner. I've already scheduled Idaho Pizza for us. I'll bring the capsules to that meeting so we can test tracking equipment. I'll also show you how to connect the capsules.

Paul, I indicated at the Saturday meeting I would be glad to put the tanks in the back of my Truck. I will bring extra snubbers and a couple of blankets so they won't rattle around. The should be secure and if I ride with someone else (I don't know if I will be single or with Deb yet) the back locks so it is secure. That way you don't have to worry about the tanks in the back of your XJ.

I noticed last night the long range forcast indicated a possiblity of thunderstorms Friday and Saturday. What kind of wrinkle could that throw in the launch plans if the possibility still exit?

That's a problem. I want to operate a 35mm camera on this flight. If we're clouded in, we'll skip to sunday or the next week. If it's only partly cloudy and not windy, we'll launch

Paul

If launched this morning, the balloon would recover just north of Anderson Ranch. In this case, we need to launch from Murphy, as it would put the capsule down just north of Glenn's Ferry.

The weather is predicted to cooperate until Friday, this weekend there is a chance of rain. If we have broken clouds, then we'll still launch.

The MRF shows winds from the west at 300 mb (about 35,000 feet). This matches what the tracking program predicts. On Saturday the prediction is for the same winds. If we're lucky, the chance of rain is just that, a chance. And it won't be starting up until later in the day.

We may have staff and students from UWyo out of Bozeman visiting for this launch.

Who will be bringing a tracker?

Two other experiments will be going up on this flight. The first is a pager. I want to call it during the flight. The second is a few thermochrons. They're self-contained time and temperature devices. The record the time and temp according to how you program them. I'll set the up for their mission on Friday at the meeting.

The frequencies as of this time are,

APRS 144.390
Voice (repeater)147.250 (did I get this right?)
Voice (simplex (146.520)

Paul

Possibly. The truck is a 6 foot bed - depends on how big it is. Hopefully it will fit and we will put it back there also.

Hi Paul,

I will be bringing my tracker. I had a noise problem but I have corrected it by running power wires directly to the battery instead of the lighter plug. I will continue testing this week to make sure it's working good. I don't anticipate any problems other than my own learning curve. You can help me make sure it's set up correctly and tracking the balloon before launching. For now I have to enter the configuration every startup until we get the registration code. Would you be intersested in testing it Friday night when we meet at Idaho Pizza?

From: Paul Verhage
Topic: 158 Message: 158

This morning's winds would put the capsule down just west of Featherville, in the Boises. The predicted landing position is just a little farther north and a bit closer to the launch site. The MRF or Saturday shows the same kinds of winds aloft. Very weak near the surface with a easternly flow at 300 mb (about 30,000 feet). The wind speeds are also low at 300 mb. So it doesn't look like there will be much of a change between now and Saturday morning. In this case it looks like we'll launch from Murphy instead of Homedale. Just across the street from downtown Murphy is their international airport. We'll fill on the runway itself.

On Friday we'll decide if we'll fly the IR camera or a beacon or a repeater. If I fly the repeater, you'll need a 440 radio to talk to it. The frequency will be 446.520 as I recall.

The pager has been set up. It's number is 467-9820. we need to call it every 10,000 feet. When you call, we need to leave a number. The number will be the altitude in increments of 10,000 feet. So at 10,000 feet, when you call, leave 1111111. At 50,000 feet, it's 5555555. I'll program the capsule to remind us.

I'll have room for three passengers. I need someone to operate their radio and my cell phone. I'll bring a doppler radio for tracking. My cell phone is set up with the numbers for the FAA and the pager. Who every rides shotgun needs to call the FAA and the pager for me.

I've sent the check for APRS. Does anyone know when the Pony Express leaves Idaho? The letter is addressed to a California address. So if they can manage to keep their lights on, we should get a reply back shortly. Please pass the word.

Also, we should proably send the word that the flight will take place this Saturday to all APRS users. If the repeater goes up, I want to advertise that also.

Who plans to be at the meeting this Friday? Bring you tracking and comm equipment. We'll run a full up test. I'll also show you how to set up the capsule. we may also do some reprogramming on the capsule.

Finally, we may have visitors from Bozeman, to watch the launch.

The repeater frequency is 147.240. That's our chase frequency as long as we're in range.

Simplex is 146.520
APRS is 144.290

If we fly the repeater, it will be 446.520

Please pass the word.

Also, I can be reached at 631-7162.

It'll get colder. I'll be putting the Thermochron inside the second capsule, where the temp doesn't get as low. But outside the capsule the temp will drop to -60 deg F, or around -50 deg C.

If launched this morning from Murphy, the capsule will recover 8 miles north of Glenn's Ferry. The predicted weather for Saturday is for a chance of rain. The MRF predicts winds continuing to come from 270 deg until Sunday. The isobars have a wide spacing, indicating low wind speeds.

I modified the flight program to send a pager message every 10,000 feet. I have also built the flight battery. All that reamins is to pick up the helium.

I'm still looking for a passenger with a radio. I think John and Justin said they could ride with me. I will have the doppler and it will be running the entire flight. Who ever rides with me will need to also operate the cell phone. I'll print directions tonight. All you'll have to do is call the FAA and the pager.

If it's cloudy the morning of launch, we will replace the IR camera with an empty panel.

Doug, how's your APRS tracker? Do we have chase crews from Ontario/Friutland?

Paul, I came up with the same location as you for a landing. There could be some problem finding the ballon that far north of Glenns Ferry. Its been about 20 years since I have been in the area but believe there are canyons in the flats north of town.

I am not sure if I am doing the calculations correctly, but I show that using tonights data the ballon would land south west of Mountain Home about 6 miles. - Lat 43.1205 and Long -115.709. Range was 42.9 miles at a bearing of 98.5 degrees.

Can someone confirm my data?

Paul

147.24+ no tone required for Cinnabar Mtn near Silver City.

Here's Jake's homepage table of contents from which you may download frequencies for many area repeaters. Your Montana friends might find it useful.
http://www.n7viv.com/contents.htm there are SW Idaho and a SE Idaho charts. Here's the one which contains Cinnabar http://www.n7viv.com/Frequency%20Charts/2mswid.html

176. Status 23 Mar

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-03-23 14:33:43 UTC
From: Paul Verhage
Topic: 176 Message: 176

I ran a few simulations this morning. If launched with today's winds, the balloon would travel 46 miles at a heading of 99 degrees. I also selected Seattle's current winds to get a feel of what we can expect tomorrow. That data along with Mark conner's analysis has the balloon traveling about the same distance, but at a heading of 80 degrees.

We'll launch from Murphy on Saturday morning at 6:30 am. I'll be there around 5:00 am to begin setting up. Filling will start at 5:30. The amount of cloudsshould pick up as the day progresses, but will proably be rasonably clear at launch. Therefore we will fly the IR camera along with the camcorder. The camcorder is programmed to begin recording at 60,000 feet, or during descent, which ever occurs first. IR pictures will be taken every 610 meters. The capsule will also ask that we call the pager every 10,000 feet.

We'll overfill the balloon and terminate the balloon closer to 70,000 feet. Plan on 3PPL (pounds positive lift) for the flight.

I'll run another simulation tonight after the meeting.

I ran the data this morning after the 3/23 12Z data was available, if launched today it would land at Lat 43.1613, and Long -115.7109 using that would put the ballon downtown Mt. Home.

Will using 3PPL significanly increase the accent rate, I seem to remember discusing 1.5 - 2PPL before? I'd like to know how this change will effect the accent rate.

Topic: 176 Message: 179

Increasing PPL increases the ascent rate up to a certain point. Beyond that it only lowers the max altitude. So over all it reduces the flight time and brings the balloon down closer to the launch site.

I plan on being there Paul
I will have a tracker for the event.
Discuss more possibilites at the meeting.

It's KD4STH-11
The frequency is 144.390, it mistyped.

Launch time is at 6:30 MST. I'll have to find the current conversion.

184. Status 23 Mar, pt 3

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-03-24 04:36:55 UTC
From: Paul Verhage
Topic: 184 Message: 184

The winds right now put the capsule down 4 miles NE of Mt. Home, if the balloon bursts at 70,000 feet. The winds from Salem put the capsule down farther north and east, just north or Anderson Ranch Res. The MRF shows winds tending to the east, south east in the next 12 hours. The winds at Salem are predicted to be northeast. So it looks like we'll be going east, about 50 miles. We'll have partial clearing tonight and increasing clouds tomorrow afternoon.

So it looks good.

Paul

185. Tonight's data

I calculated tonight's data, came up with a landing about six miles north of Mt. Home. The latitude and Long. is 43.2433 and -115.6371. Range of 46 miles,bearing of 87.3. Flight time of 97 minutes.

Anybody else do the calculations?

188. TVNSP flight below I-gate coverage

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-03-24 15:53:12 UTC
From: Mark Conner
Topic: 188 Message: 188

It appears TVNSP went out of I-gate coverage at 1540Z. Max altitude was just under 70,000 ft about 20 miles ENE of Mountain Home, ID. Last location was 10 miles SW of Fairfield, ID at 27,000 ft. Prospective landing area does not appear to have a lot of roads and looks fairly rugged in places.

EOSS-48 has been delayed to about 1700Z this morning.

190. TVNSP Flight

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-03-25 03:09:01 UTC
From: Paul Verhage
Topic: 190 Message: 190

I have a few choice words about the mountains in Idaho. We friggin' landed on one. We could only get a little under three miles from the balloon. We parked the cars at 5100 feet and had to walk a bit over four miles and 1200 feet higher to retrieve the capsule. It took three hours to get up there and another two hours to get down. We had data all the way down to landing. I haven't had a chance to look at the data yet, and proply won't until Sunday, when I should be in a better mood. Justin noticed some fogging on the camcorder. The battery was discharged by the time we got there, so I suspect we got video all the way down. The IR camera when spastic on us and began taking a series of pictures of the runway from an altitude of two feet. On Monday I'll have them developed. I'll also read the thermochron data on Sunday along with the APR data.

I want to thank the TVNSP crew for goin' to the mountain. The University of Montana students weren't spooked by the experience.

Man do my legs hurt.

Glad you made it home okay. I do believe we all have tired legs, even those of us that didn't make it to the top. It could have been worse. In a normal water year there would still have been several feet of snow on the valley floor. We would have needed snow mobiles to get to the capsules...

It was fun, enjoyed the trip, as always. We will have to do this again sometime, but next time land the stupid capsule on the flats..... :-)

I did the ballon trip calculation from this mornings data, the landing was at:

43.0384 Lat and -115.0093 Long
Bearing of 98.4 degrees and Range of 78.6 miles.
I used a ascent rate of 700 ft/min

Anyone else try it? Looked like it would land several to the west of where it acutally did and on the south side of the mountains we (you) climbed up.

Just a quick reply here:

I will let Paul fill everyone in on the specifics.
Mark i did message from you via our local i-gate at launc pad.
Too busy to reply there. The landing lat/lon from my tracker was
43.2176667/114857666. Rugged country but accessable by foot. Minimum snow
luckily.
Thank for watching. A further synopsis will follow from Paul, i am sure.
What a great hobby. We should'nt be allowed to have so much fun!

Doug,

The last report I had on APRS was at 7689 ft. The lat was 43.216383 lon -114.85706. The landing site elevation was about 6300 ft. Paul will be reviewing the data today.
Who put that mountain there anyway? It was a difficult climb. The terrain was rough, the patches of snow was sometimes knee deep (burr!!), some places were rocky, some places thick with brush, lot's of slippery sticky mud, and a few ticks that hitched a ride.
Paul, that bug that was on your sleeve at the restaurant was a tick. I had one in my truck also. Everyone that was on that mountain should check for ticks.

201. Landing Site

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-03-26 06:05:05 UTC
From: k7jps@arrl.net
Topic: 201 Message: 201

Just got back from Givens Hot Springs, man do I feel a lot better then I did this time yesterday!!

My GPS recorded a lat/long of 43.21772/-114.85778 at 8:41 MST (15:41Z) from the balloon, this was the last change in position that it received. Launch Time was at 6:45 MST (13:45Z) so the flight duration was 116 minutes.

I marked our recovery position as well on my GPS. It was at lat/long of 43.21772/-114.85778 - yes that is the same lat/long, at an altitude of 6306'. I marked the recovery position at 12:34 MST (19:34Z). Paul was ahead of me by 2 or 3 of minutes, he seemed very ecstatic when he heard the beacon!

I am in the process of setting up waypoints on our overland track and should have a pretty good estimate of how far we had to hike to recover the balloon soon. I do know that we had an elevation gain of 1221'. I'd like to thank Randy for the connector cable he let me borrow for my Garmin GPS. Since my wife just gave me the GPS last Wednesday, this sure was a good way to break it and me in (in more ways then one.) My own connector won't be able to get here soon enough.

Now that I've had some time to play with my new toy, I have figured out how to reset the trip meter without wiping out all of the track data. Next time it will be easier to figure out how far we hike, but I wish I could download my track to a PC and let it do the calculations.

203. Waypoint+ software

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-03-26 09:59:33 UTC
From: Conner, Mark
Topic: 203 Message: 203

If you'd like to upload/download data from a Garmin, check out
http://www.tapr.org/~kh2z/Waypoint/

You can download your track data and see it within Street Atlas USA.
Really works well. I think you can then use SA USA to compute the
length of the track.

You can also manage waypoints, routes, and other functions with this
software.

From: Conner, Mark
Topic: 204 Message: 204

ftp://ftp.tapr.org/aprssig/aprsspec/spec/aprs101/APRS101.pdf

Lots of good info in here for creating APRS-compliant data. I've used it a lot for figuring out how to format telemetry data, messages/bulletins, and putting time/lat/lon/altitude data all into one packet.

For example, in my code I now send out a message to my car's APRS setup and a bulletin whenever I lose GPS data or when burst is detected. That way you don't have to watch the raw data going by to see if it's burst.

It does require more processing by the Basic Stamp to make a packet with time/lat/lon/alt all in one. However, it does make it easier to analyze the logs since you have all the necessary data in one line. I have some Basic Stamp 2 routines that will parse the GPRMC/GPGGA strings and will format an APRS location packet.

The telemetry format is somewhat limited since you can only have values from 0-255.

206. Flight Report

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-03-26 20:57:56 UTC
From: Paul Verhage
Topic: 206 Message: 206

Here's what I have so far.

The camcorder did not record, but the battery is discharged. There is no message that the camcorder was instructed to begin recording, but by looking at the GPS times, it looks like the command was issued. I'm taking the camcorder in today to have it looked at.

The stamp stretcher on the capsule is defective. This prevented the status data from being taken and made the IR camera act up. I'll talk to Scott Edward abouyt getting its PIC replaced.

The experiment data looks good. It looks like the bottles did not hold their pressure. more on that after i finish the spread sheet.

The iButton data looks alike. I suspect the reader didn't update the diskette properly, so I'll reread the data. John, I'll need the serial numbers of the iButtons and their locations.

We need to bring an extra handheld GPS with us when recovering the balloon. We should also bring water and munchies, in case it takes longer than we think.

We have a meeting scheduled for this Saturday to discuss the flight. Please let me know if you have an extra set of pictures. I'll buy a set from everyone.

Our next flight is 28 April, in conjunction with the Hamfest and the Boise Astronomical Society (Astronomy Day). We need tracking stations set up at the hamfest and DCI.

I'd like to set up a table at the mall on the 21st, to advertise the launch. would anyone like to help me out?

I'm thinking about reflying this manifest in the middle of May.

Paul

213. Status, 1 Apr

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-04-01 20:07:43 UTC
From: Paul Verhage
Topic: 213 Message: 213

Here's what we discussed at last night's meeting.

The next launch is 28 Apr. We'll have a meeting on the 21st at the Discovery Center (DCI). we want to bring some equipment and do a test set up. Afterwards we'll eat dinner at the Galaxy Dinner.

On the 21st is a Boy Scout event and (I hope) a table at the Mall. We'll need help on both these events. John, do you want to add anything regarding the Boy Scouts?

I'll set up a table at the mall to inform people of the launch.

The following meeting will take place on Friday the 27th. This meeting will also take place at DCI. This meeting will set up equipment. Doug, will you still run Mission Control for us?

I'm looking for CDs of webpages for the April flight. The CD ROMs will go up on the balloon capsule.

Is there an interest in ball caps for TVNSP? Or possbily patches? If there's an interest, I'll look into costs.

Also we discussed magnetic signs for chase cars. Is anyone else interested in getting a sign for their car? Again, if there is, I'll look into costs.

I'm also looking for donations for helium. If you or your club would be interested in helping to pay for helium, let me know.

We'll try to refly our last flight in the middle of May.

We have money from the Idaho Space Grant Consortium to launch the August flight.

Paul

217. Glider Fox Hunt

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-04-02 19:50:20 UTC
From: Paul Verhage
Topic: 217 Message: 217

One other item discussed at Saturday's meeting is for a fox hunt of a glider dropped by a balloon. The hope is in the fall to launch a balloon with a four foot glider. The glider will carry an HT (DJ-S11?) and a beacon controller. We'll carry the glider up to 50,000 feet and release it. Anyone can fox hunt the glider. the first person to find it gets the HT and glider (I'll need the beacon controller back for next year).

If we do this, I'll be looking for donations for the HT.

Is there any interest in doing this?

220. Getting the correct lift w/o a scale

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-04-03 20:42:48 UTC
From: Mark Conner
Topic: 220 Message: 220

Hi all,

One of the main problems I've noticed with amateur radio balloon flights is getting the proper amount of helium into the balloon. The common way to do this is to use something like a fish scale to determine the amount of free lift available, but this doesn't always work. The main problem with this method is getting a good reading. Either the fill apparatus is weighing down on the balloon, and/or the wind is buffeting it.

With a grand total of two flights under my belt, I suggest an alternate method.

A standard "T" tank of helium has 291 cu ft when filled to a pressure of 2640 psi (at 70F). Most places do a 10% overfill, but that's not critical here. The main thing is that you can use the cubic foot to psi relationship as a pretty fair guess - perhaps to more accuracy than using a fish scale in the wind.

You can use the LiftWin program available at http://www.geocities.com/CapeCanaveral/3161/liftwin.htm to determine how much helium you need to put in your balloon to lift the payload at the desired ascent rate. However, you don't have a means to measure how many cubic feet have been taken out of the tank, but if you're using a regulator you do have a tank pressure gauge. So you basically need to figure out how many "psi" to put in the balloon.

Let's say that LiftWin calculates that you need 250 cu ft for your flight. So, to compute how many "psi" that translates to:

250 * (2640 / 291) = 2268 psi

So you need to run your tank down by 2268 psi to get the 250 cu ft of helium out. If you tank reads 2640 psi at the start, you need to run it down to 372 psi. You can split this psi difference across two tanks if you have partially filled ones.

This assumes no leakage of helium, and that temperature effects are not significant. This may not be true. Figuring that it's always better to go up too fast than too slow (or not at all), I put some extra in above what the figures give me - maybe an extra 100 or 200 psi.

I had good results with this on the previous two launches, coming pretty close to my desired 1000 ft/min - one was 890 ft/min and the other was 1043 ft/min.

A separate topic for those on the KNSP list - the Treasure Valley Near Space Project page is at http://www.the-one.com/tvnsp/ .

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-04-03 21:02:05 UTC
From: Paul Verhage
Topic: 220 Message: 221

Does elevation of the balloon during filling make a difference?

When the air pressure is lower, you need a greater volume of helium to displace enough atmosphere to get your desired lift. However the steel tank is not effected by atmospheric pressure. I assume they fill the tanks to roughly same pressure. If so, then elevation of the balloon shouldn't matter. After dumping a fixed amount of pressure, the lift of the balloon should be the same, but the balloon's volume will be greater if filled in the mountains as opposed to being filled in the plains.

It seems to me this method should work, regardless of atmospheric pressure because the pressure inside of the tank is independent of outside atmospheric pressure.

The temperature of the tank will have an influence. To determine the effects of temperature, you must use an absolute scale, like Kelvins or Rankin (which start at absolute zero). A cold day may have a temperature of 273 kelvins, a hot day may have a temperature of 298 kelvins. The change in pressure is then 298/273, or 1.09. The greatest amount of change should be on the order of 9%. And remember, that's between freezing and a temperature in the 80's.

Paul

Jeff

You will not need a HSP cable for your TNC. That is the nice thing about the KPC-3+. You hook up your GPS and radio to the DB9 port. The TNC will key the radio automatically with the lat/lon from the GPS and any other beacons you pre-program into the TNC. The Db25 port is used when you run your laptop.

I will send you the wiring pin-outs if you need them. Also you can run 12 V power to your gps from the DB9 connector with a change of two jumpers inside the tnc.

223. Re: [tvnsp] Glider Fox Hunt

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-04-03 23:18:11 UTC
From: Randy Farley
Topic: 217 Message: 223

I like the idea Paul

I assume the normal chase teams will pursue the balloon while the fox hunters will go for the plane?

I think it would generate more interest in fox hunting and or balloonery (i guess that is a word) <;) I think everyone would like a radio for a reward.

It would be nice if we could set the glider in a spiraling pattern so it does not take too long of a flight in distance. I guess that should not bother a real fox hunter. Just a thought. Any other concerns out there?

I will be glad to donate a small sum for the radio.

> hanging a 2# weight on the bottom of the payload and fill
> until it balances (wind permitting)? :-)
>
> Well, 2# minus the positive-latching-but-quick-release
> mechanism... :-)
>

A variation of this has been tried, where a weight containing the desired total free lift is attached to the balloon and filling until it lifts the weight. The problem is accounting for the fill device, which is attached to the tank and has to be held up. Plus the wind causes a lot of jerking due to turbulence, making it difficult to see when it's really lifting the weight.

Normally the payload is not attached to the balloon until after filling. Plus the top-to-bottom length of the payload is 20 ft or more, making it hard to fill the balloon with the payload suspended.

Pete Sias uses a balance that helps to account for the fill mechanism weight. He has a large indoor shed w/concrete floor for filling, so wind doesn't bother him.

Bill Byrne brought up a point in a separate e-mail saying that expansion of the gas from the cylinder cools it. Paul made a similar point that the gas temperature must be taken into account. This is true, and using the formula for isentropic expansion yields a gas temperature of 34K when going from 3000 psi (tank) to 15 psi (atmosphere). I don't think the gas in the balloon is 34K, so heat is getting into the system (no longer isentropic). I think the free atmosphere heats the helium to near ambient temperature during the fill process. It would be interesting to measure the temperature of the helium near where it's vented into the balloon just to see what that temperature is.

BTW the formula is (T2/T1) = (P2/P1)^(R/Cp) R/Cp=0.4 for He

The method I outlined isn't perfect because it's too simplistic. However, it can be used as a cross-check for other methods, or (I think) an acceptable substitute when using scales or weights doesn't work due to wind or other factors.

That's right. After recovery of both the balloon and the glider, we'd all join up some place for lunch or a barbeque.

We could bend the rudder and ailerons. That will put it into a banked turn.

Hi Paul,

I did a search on John Stone's name at http://www.qrz.com and came up with a John Stone in Caldwell, Idaho. His call sign is K7JPS. I recognize that call sign from the balloon chase so I'm sure it's correct.

Hi Randy,

The Kantronics manual shows how to hook up the GPS and laptop with an
APRS-HSP cable. I cannot find how to hook it up to the DB9 port. Please send me
the wiring pin-outs.
The Gamin etrex Legend is on sale at http://www.gpsdiscount.com for $206
plus shipping. I've been comparing prices and models and this one seems like a
good deal. It comes with a PC interface cable. Opinions anyone?

Hi all,

Here's a web site I have to share with you.

http://www.pfranc.com

This guy makes the round and square plugs for Garmin GPS's. They send you one or two plugs and if you like them you pay for them. You make a pledge to pay for them and you pay what you think they're worth. It's like shareware but it's hardware. This will help all those who wish to build there own cables.

I have purchased a half-dozen of the round plugs and have been very pleased with them. My local pfranc rep put them in the mail the day after I sent the e-mail to request them.

Be sure to read the assembly instructions thoroughly before starting the assembly - I mangled one by not doing so.

I just got my first plugs last week and they work great. I had the plug two days after I pledged. I was able to use the track I downloaded in Waypoints+ to calculate the distance we hiked to recover TV01A - it was 7.57 miles with a 1221' elevation gain. (If you would like a copy of the track data from the hike so that you can try it with Waypoint+, just e-mail me.)

Not that this is experience speaking, but the one think that can not be over emphasized is to make sure you know the power requirements of your GPS. If it needs a regulated voltage, then make sure you don't just use any cigarette lighter adapter off the shelf.

Good observation John. I have two Garmin GPS's. One operates on 5-8 v. and the other one handles 10-40 volts. They both have similar plugs. Good idea to mark them to prevent possible damage, especially if you have to loan one to someone.

John, i would like your track.

It's at one of the schools. I believe Vallivue. But I don't know if it's the high shcool or middle school.

Doug has volunteered to run a tracking station at DCI. But no one (as far as I recall) has volunteered to operate a tracking station at the hamfest.

John Knapp, do you have an HT to run the doppler from? It needs to have a PTT lock, so the HT can't transmit through the doppler antenna.

Paul

Paul,
Consider comparing the cost of a serial port PC card to a KPC-3 plus. The tnc can be purchased from Ham Radio Outlet for about $155. I don't know what the card cost's. I think the performance will be much better than having to use an HSP-Cable. I don't know this from experience, just listening to what others have said. How about some comments from some of you with experience in this area? I will be wiring my new GPS directly to my KPC-3 plus. Randy showed me how.

The Hamfest is at the old Vallivue High School, Not sure of the address.

I will check to see if I can run a tracking station at the Hamfest from the Club trailer during the Hamfest - I wouldn't be able to chase if I do. I know the trailer will be there but I don't know who will be setting it up, etc. I will find out about the trailer at the next committe meeting on April 16.

Paul, I do have a PTT lock on my handheld, however it is the only radio I have at present. But I could use it on the Doppler Receiver.

I had the chance to walk out my back door and across the field to
Vallivue Middle School this afternoon with my GPS in hand. I think
that the soccer fields would be the best place to launch from since
the football field is encircled by lights. The lat/long for the
soccer fields is 43.60872°/ -116.68977° at an altitude of 2630'.

I'll be at the April 18th meeting. The van sounds like a good idea. Do we have more than one person who wants to op the van so you can go on chase?

I'd like for you to run the doppler. Let's see if we can round up a passenger for you to run communications.

Paul

Jeff made a good observation and suggestion. The HSP cable was a fix for not having enough serial ports in the old days before the KPC3+ came out. I would personally not trust the performance of a shared port for collecting critical data from a balloon.
Maybe others have had good experiences with the HSP cable method. It was okay for me at first for just casual tracking, but it had a lot of missed data reported to my laptop. I opted for the serial card before the KPC3+ came out.

Besides, Paul probably makes so much money, he should even consider one of the newer radios with built in tnc's. Paul, please don't flame me <;)

Decision,Decisons
Too much fun to be had by all.

Randy

I will be at the hamfest and will do what I can there. I thought the DCI gig was for the last balloon flight. If I got it wrong, I am sorry. If there is a choice between DCI and the hamfest, you know where I will want to be.

For those of you with USB on your computers, check out:
http://pfranc.com/usb/usb.htm

This is for USB rather than PC Card, but if you have USB should work great.
Lots of good comments from APRS SIG. I just ordered one yesterday.

It sounds like we need to work out some scheduling details for the 28th. Let's start with these questions:

1) What time does the hamfest start?
2) What time does DCI open?
3) What time is the launch planned for?
4) How many hours will the tracking stations need to be manned?
5) Can the person that mans DCI be relieved so that he/she can attend the hamfest?
6) How many tracking stations are available on the 28th? There should be at least one on the chase, one at the hamfest and one at DCI.

Paul,

I have a couple questions....first, I did receive my registration number for APRS. Now the question: Where do I enter it? I have downloaded the latest copy of WinAPRS, and I cannot find where to enter the number. Second question, what is the TVNSP website address?

Thanks,

Mike KC7DPD

As I recall, there is a menu item at the top called register. I'll have to look at mine again to see.

The website is located at www.the-one.com/tvnsp/

9:00 am, but we need to set at 7:00

> 2) What time does DCI open?

They open for the public at 10:00 am. We need to set up the night before.
We can get in an hour earlier, as I recall.

> 3) What time is the launch planned for?

We'll try to launch at 9:30 am

> 4) How many hours will the tracking stations need to be manned?

Let's plan for three hours.

> 5) Can the person that mans DCI be relieved so that he/she

Doug will be attending the hamfest, so I think we're covered there. We need
to find someone to cover DCI.

> 6) How many tracking stations are available on the 28th?
> There should be at
> least one on the chase, one at the hamfest and one at DCI.

Randy, will you be helping with chase?

I should have a tracking station, but it won't have a GPS.

Jeff, where do you plan to be?

We need to find a setup for DCI.

Paul

I checked my laptop last night, I don't have a USB port.

So far the cheapest PC card I have found is from CDW for $128.51. That's
still cheaper than going with a KPC3+.

Does anyone have a lead on something less expensive?

Hi Mike
You need to put the registration number in the Setup/main/registration box just under the Callsign box in APRSPLUS.
You can get the latest version (aprsplus199YQ.zip) at:
http://www.tapr.org/~kh2z/aprsplus
or
ftp://ftp.tapr.org/aprssig/winstuff/aprsplus

I can do the DCI site if no one else wants to. I prefer the chase,but it looks like we have some very good chase crews trained now. It would be nice to take it easy at a cushy table demoing balloon tracking <:)
I would just need some direction on where to set up radio. laptop ,antenna etc.at the DCI.

261. April Launch

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-04-11 13:40:09 UTC
From: Paul Verhage
Topic: 261 Message: 261

So far we have Jeff doing chase, Doug operating a station at the Hamfest, and Randy doing Flight at DCI. I'll help out with the launch and chase.

Can we get some more people to help out Randy at DCI? There will be some astronomy people there also. But don't worry, they've had their shots.

I can track the balloon, but may not have a GPS set up in my car.

We need to set up DCI the night before.

Paul

262. Status, 11 Apr

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-04-11 18:05:21 UTC
From: Paul Verhage
Topic: 262 Message: 262

The capsules for the next flight are complete. The flight code is complete also, but I need to check it over once more. I'll bring the capsules to the radio club meetings for this month. I'll also bring them to the astronomy club meeting. There are three connections to make between the capsules for this flight. Two are for servos and the third is for a operating a camera shutter.

The SSTV camera head rotator servo is connected to servo channel 1. The dropper servo is connected to servo channel 0.

The IR camera is connected to I/O pin 0. This pin is by itself and is not part of the CC/PS expansion port.

I'll make the required internal connections before launch. These connections are for the bug cabins, the sounder, and the geiger counter. The sounder flew on flight TV00A, last year. It measures temperature, pressure, and relative humidity during the flight into near space. I'll email the details about the channels they will be connected to. But for now, the cabin is plugged into channels 0-3 and the sounder is connected to channels 4-6. There is nothing connected to channel 7 for this flight (TV01B).

Geiger counter data is sent prefixed with a GM header. The number that follows the GM header is the number of counts in ten seconds. Here are the expected numbers. At launch the count will be 0 to perhaps as high as two. At 60,000+ feet the count will climb to as high as 800 counts in 10 seconds. The counts will drop off as the capsule climbs higher.

The glider is scheduled to be released at 75,000 feet. The IR camera will record a picture every 2500 feet. The camera will also take a picture a second after the glider is released. There will be a GLIDER message sent once the glider is released. The glider needs to be connected to the dropper at the launch site. I've redesigned the dropper. It takes only a couple of seconds to attach it to the dropper. It's a no sweat task, unlike last time it was used.

I made a change in the GPS flight code. This should allow the altitudes to be updated properly during the flight. This stops the "Bad GPS Data" message and let's the capsule determine when the balloon has burst.

I am planning to chase and would be willing to do navigation /communications again. I can be at DCI to help setup on the 27th if I am needed. Also, if we don't have to move the launch site from Hamfest, I can provide the Saturday Winds data to the other chase crews since my house is only 1/4 of a mile from Vallivue Middle School.

One other thing, with the info that Paul sent out on the capsules I can start a check list for review.

Thanks. John Knapp will run doppler. I'll take John Stone in my Jeep for comm and nav. Justin, do you plan to attend this launch?

Doug has a neat APRS setup he'll demo at the hamfest.

I'm looking for additional help for Randy at DCI. Anyone local to Boise who is not planning to attend the chase that could help out at DCI?

Also, I got a message from the state of Idaho. Electronic teachers are suppose to have a two day conference on the 20/21 April. I can't make either the mall (so that won't happen) or scout camp. I'll lend John a capsule, some photos, a 'chute, and video. Do they have access to electrical power at the camp? Do they have a video tape player and TV? I'll get with you before next week's meeting. We can plan by email and I'll bring the stuff you'll need for the scouts.

Paul

268. FW: [aprssig] NSTAR 01A balloon flight Saturday

269. Status, 12 Apr

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-04-12 13:39:30 UTC
From: Paul Verhage
Topic: 269 Message: 269

Here's the format of the experimental data for this flight. The channels will telemeter data on the bug cabins and the sounder. The channels are as follows.

1 = Cabin 1 pressure
2 = Cabin 2 pressure
3 = Cabin 1 temperature
4 = Cabin 2 temperature
5 = atmospheric pressure
6 = atmospheric temperature
7 = relative humidity

Cabin one is covered in aluminized mylar. Cabin two is cover in black paper and sealed with teflon tape. Both cabins use a rubber washer. I gave them both a squeeze. They didn't leak air. If they both hoild pressure, we'll need bug volunteers for the May flight.

We plan to have a generator with us so we can have 110 volt with us. But the main power will be 12 volt batteries. If nothing else we can set up the capsule for a static display and I will say a little about the Near Space Program in the information I give the scouts.

On the launch on April 28, I may have a couple of riders who are interested in the program. One is a Hot Air Ballon instructor, the other thinks the whole idea is neat. Neither are hams but would like to help launch and chase.

I suppose you could use a live capsule and display data on APRS. But you've got to watch that capsule like a hawk since it goes up the following week. I'll plan to lend a parachute, video tapes, and a capsule.

Excellent. It'd be neat to test a parachute from a hot air balloon. Or perhaps video a launch from an airborne hot air balloon.

Ideally that is what I would like to do, however I am not sure of the status
of the PC in the trailer.

I will have a canopy there for cover from rain, etc so it wouldn't get wet.
By Wednesday I will know more on the trailer setup.

Hi Paul,

My new Garmin GPS arrived yesterday and I am becoming familiar with it. I hooked it up to Street Atlas and it works fine. The next step is to hook it up to the TNC and test it. I don't anticipate any problems. My tracking station will be ready for the chase with a GPS.

Great.
We'll need your tracking station.
I'll be placing my station at DCI for Randy and the SSTV.

Alright folks, this is the task for the May flight.

> The video on the way up was clear to maybe 40,000 ft. Descent video
> looked like the lens was fogged over, but the camera did operate until
> landing. However, all you see is green, blue, green, blue,
> thump. So Paul
> still has a chance to get the first viewable video of a landing.

Idaho tends to have drier weather, so we may not have the fogging. I ran a test on the camcorder earlier this week. A fully charged battery was left on the camcorder while it was shut off for one hour. I then ran the video for 30 minutes. There are five LEDs on the back of the battery. Five indicates a full charge. Only one LED went out during the test. I'll try the test again later this month. For the May flight we'll use a 600 gram balloon and fill it to three pounds positive lift. I won't start the camcoder for at least an hour.

If you'd like to subscribe to Mark's email list, it's KNSP at egroups.com.

276. Meeting Saturday, 21 Apr

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-04-16 20:26:40 UTC
From: Paul Verhage
Topic: 276 Message: 276

I have a meeting on Saturday, but it should let out by noon.

The next TVNSP meeting is scheduled for Saturday. Let's plan to meet at DCI at 4:00 pm. We'll need to bring radio and PC gear for mission Control. I'll bring an HT and laptop for SSTV. Randy will bring gear for APRS. Randy, can you bring gear for voice? We'll need external antennas. From mission Control to the outside is proably 50 feet. So we'll need cable runs that long.

I'll bring both capsules. Once equipment is set up we'll run the capsules for 30 minutes as a test.

After the debugging and documentation, we'll have dinner at Galaxy Dinner.

Paul

PS, let me know what you can bring to DCI. We're still looking for more help for DCI during the flight.

I will bring voice and APRS radios and battery or do we have AC available for power supply. I have coax runs of 40 and 100 feet. I can make up another 30 foot piece i have laying around. I have one portable dual band mag mount and one on my pickup available.

Paul, What's the website for the SSTV software. I can try to set that up on my lap-top. I'd offer it for the chase but the batteries are shot and it needs 120v power to run.

We'll need a radio, antenna cables, antennas, and place to set them up, and laptops. I think between Randy and me, we have it covered. Can anyone else think of something I'm missing?

I'll leave some near space capsule stuff, like a balloon (which DCI will fill inside the building), parachute, video, pictures, and a poster.

We ought to think about labels. I'd like to get a big one tht says Mission Control.

283. Status, 19 April

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-04-19 17:12:23 UTC
From: Paul Verhage
Topic: 283 Message: 283

The MRF shows a deep trough off the coast. This creates winds from the south. If we launch under those conditions, the balloon will go almost straight north. I imagine the 9 day forecast is not very accurate, but we need to keep an eye on this situation.

If the winds are from 180, then we need to look at launching from Jordan Valley.

Montana plans to attend this launch. This time the director of their Space Grant Consortium will attend with the students.

Don't forget, we'll meet this Saturday at DCI at 4:00 pm. Dinner follows at Galaxy Diner.

The SSTV will be transmitted on 147.585.

http://www.ua.nws.noaa.gov

This has practically all you ever wanted to know about the NWS radiosonde (balloon) program.

Two interesting tidbits:

1) NWS gets about 20% of their sondes back.
2) By 2005 or so, the current ground stations and sonde design will be replaced with one based on DGPS.

The MRF is predicting southwest winds, but weak. So we may have to launch from Jordan Valley.
The NWS is predicting a chance of showers.

We'll see as we get closer.

At dinner last night I thought of developing a club, like the ham clubs, for the balloon project. I'd like it to get non-profit status and hope that brings in donations for helium. One of the major pushes of the club is to get others to develop near space capsules. Any input?

Paul

Paul,

I think it would be a great idea to have a separate club for the balloon project. I am considering building a capsule myself sometime in the future, and a club that concentrated on high altitude balloons would encourage me to pursue it. Count me in!

From: Paul Verhage
Topic: 288 Message: 288

I got SSTV working on my laptop last night. Here's the settings.

Select Robot 36.
Click on Auto-RX
Click on Auto Save
Under the Edit menu, select Settings

In settings, click Use Bandpass Filter
Click on Softer

Save the settings.

When SSTV starts up, it will default to Scottie-1. Now I don't have anything against tyhe Scotties of the world, but this setting won't work for SSTV. You'll have to reselect Robot-36.

SSTV frequiency is 145.010. The SSTV unit on the balloon transmits an image every three minutes, I tested this last night.

The next meeting is on Friday at DCI. I'll be there at 3:30. After we set up, we'll head over to Texas Roadhouse. Good food there.

Paul

If launched to day the capsule would land at a heading of 121 degrees and a range of 67 miles. Not too bad, I think. I'll see where that is.

The MRF for Saturday shows a southwest wind, but not a much south as earlier in the week.

Paul

Count me in.

May need a workshop to help me with capsule electronics. I
can build the physical capsule with no problem, but some of
the electronics still make me say "gee whiz".
This is fun stuff. Lets go for it.

I have mixed thought about a club. I am continuing to build support in the VOI for a special interest group. There are many advantages doing it this way. Some are funding, included in a million dollar insurance umbrella, a larger base of people who have some interest.
If that does not pan out, I will support a new group and see if I can bring all equipment provided by BOI. I might even get annual grants from VOI. There is such a close tie to ham radio that I prefer the VOI special interest group (BOI).
Time will tell. I am trying to bring the subject to a head at VOI and either do it with full support or not.

Doug

Insurance is an issue. Being a part of ARRL gives some insurance coverage,
as I recall. A balloon program may want to do the same thing.

I too have mixed emotions about a club. Annual liability insurance for a club through ARRL (there is nothing cheaper that I could ever find) is $325 per year. Insurance to cover club owned equipment (if desired) is another expense and then add to that other necessary expenses of maintaining a club and it would take a number of people willing to pay a rather large membership fee to support it until the membership grew large enough. Then too, you have to be watchful for nazi types that want to take over your club and push their own agenda to the exclusion of other members. There will always be some members in any organization that support you but may be unable or unwilling to participate in activities. It takes considerable effort and some expense to maintain communications with ALL the club's members and when you stop communicating with them you lose them. These are the reasons that many ham clubs fail. I am also fearful that we will lose the wonderful informality that the group now enjoys. The decision to start a club should be made with our eyes wide open!

On the other hand, it forges together a group of people with a common interest and makes possible certain financial benefits that we do not enjoy operating as we do now. From a selfish perspective, I could see more launches so therefore more opportunities for a launch to fall on a day that I could participate. It would also add a perceived "legitimacy" by being an 'official' and legal organization.

So the bottom line for me is, I would support a club but will also continue to support the status quo as the group desires.

When is our next meeting and how did the meeting Saturday go?

Randy, thanks for the help on Saturday, hope you made it back okay. I know the roads were slick. On Sunday, the sun was out and dust on the roads. Go figure.....

> When is our next meeting and how did the meeting Saturday go?

We meet at DCI after work this Friday. I plan to get there around 3:30. The Montana Boys plan to be there around 5:00. I gave them my cell number. The goal is to set up the antennas and mission control. Afterwards we'll have dinner at Texas Roadhouse. Get ready to throw some peanut shells around.

We pretty much figured out what needed to be done, last Saturday. It also let me know that the SSTV system needed some work.

There may be a launch the third week of July in Twin. They're interested in an ATV flight. This one would also act as a practice for the August flight. More as the details come in.

Paul

I'm working on the 21st of July but off on the 28th if the launch can be moved back one week.

298. Status, 24 April

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-04-24 20:04:09 UTC
From: Paul Verhage
Topic: 298 Message: 298

If launched this morning, the capsule would recover seven miles south out Mt Home AFB. The capsule would have only travelled 37 miles.

The NWS is predicting dry skies and mild temperatures for Saturday. However the MRF is predicting winds from the southwest. The longer we wait, the more the winds come out of the south. A low pressure ridge is building behind us, just off the coast. We're also predicted to be on the edge of pretty strong winds in the jetstream. If this doesn't change in the next day or two, we have to launch from Murphy or farther south. How does everyone feel about a launch from Jordan Valley?

After I get back from vacation, I want to get members started on designing experiment modules. I'll design a board for the Basic Stamp that will operate servos, cameras, and analog to digital converters. After you build a capsule, either Doug or I can carry it up on a flight. The design will allow for communication from your module to the command module. I'll also design the board for an EEPROM memory chip, so data can be recorded onboard (your capsule's very own black box). Eventually I'd like to get members to design their own command modules (that's more expensive).

To do this, you'll need to purchase a Basic Stamp. There are three options for you. You can get just a plain BS-2, a BS-2 with programming board, or a BS-2 with a Board of Education (BOE) board. The cheapest is just the BS-2. However you can't program it until the balloon board is made. The programming board will let you practice writing code, but it's wasted once you transfer over to the balloon board. Also, you'll need to purchase a breadboard to play around with electronic designs. The BOE is the most expensive, but it includes everything you need to program the BS-2 and build electronic designs. Take a look at www.parallaxinc.com for more information. As a teacher I get a 15% discount from them. If there's enough interest I recommend we decide on a plan and order the parts in bulk with my discount.

After I design the board we'll need to find a place (basement?) to make the balloon controller and solder them together. I'm thinking this would make a great winter project for the group.

There's an APRS conference this September that I'd like to go to. Stephanie, can you give me the website so I can look up the info? Would anyone be interested in going with me? I'll email the coordinator about setting up a mini-symposium that we can speak at. And if I got it right, SEA-TAC is in June. I'll be gone this June, but would like to go next year. Again, I'm looking for members to go along. You're all getting to be experts, so we can give a great presentation.

Paul "Dude, where's my balloon?" Verhage

Paul- I would be interested in your design & capability.

> There's an APRS conference this September that I'd like to go to.
> And if I got it right, SEA-TAC is in June.

SeaPac is June 1, 2, & 3 in Seaside, Oregon. Check out www.seapac.org for
more details.
There will be an exhibit of APRS there by the NWAPRS group.
http://nwaprs.org
NWAPRS had a winter conference up in Longview, Wa. a few months back. The
summer (fall) conference, is September 7, 8, & 9, in North Bend, Wa.

Hi Paul,

The NWAPRS summer gathering will be September 7-9 this year at VaLLLeyCamp near North Bend, Washington. You will need to contact Dave Dobbins (mailto:ddobbins@...) to be put on the program. If you really want to cut through the steep learning curve for APRS this is the place to go. There is information for newbies and old hands alike. You can stay in the beautiful lodge or bring your camper or tent. Full hookups are available. All seminars are held outside in a large open air dining area set amongst the trees. Very beautiful. You can find more information about this event and other NWAPRS events at:

http://www.nwaprs.org/eventslist.htm

The SeaPac Hamvention is June 1-3 this year. Friday's activity is a hands-on antenna building workshop with hamfest and seminars all day Saturday and Sunday until noon. Pre-registration is suggested for the workshop as it has limited seating. More information on SeaPac can be found at:

http://www.seapac.org/

Stephanie

I came up with about 42degrees 52 min N and 115 deg 49 min W. for this afternoon's readings. This puts it SW of Bruneau about 4 miles. I came up with about the same thing this morning but further east. I have a flight distance of 44 miles. Am using 80,000 burst height and am using Murphy as the launch point. The ascent rate is 700 fps and descent is 1200 fpm (this from the last launch). Anyone else getting the same or am I way off base?

What is the lat/long for the Jordan launch point and what time are we looking at if from Jordan?

I was able to get 5 barrel connectors to connect the coax together,
I'll bring them on Friday. I also heard tonight that there will be
some ham's working the March of Dime's run in Boise on Saturday
morning and they are using 146.52 for comm. so we may want to choose a
different simplex frequency if we get out of range of the .24
repeater.

If launched this morning from Jordan Valley, the capsule would land between Mt Home AFB and Jordan Valley. The lat and long for Jordan Valley is 43 deg N, 117.1 deg W. I'll try to pin down more accurate measurements later this morning. In the next 24 hours the winds will begin coming out of the southwest and picking up speed. If we launch at Jordan Valley, we'll put the capsule down in the valley. I recommend we make the 1.5 hour trip to J.V. and launch from there. If we launch from Murphy, then we save time going to the launch site, but lose time during recovery. at least from J.V. we'll be near to home at landing.

With a launch at 9:30, we need to be filling by 8:30. That means we need to arrive by 8:00 am. And that implies we must leave by 6:30 am. I recommend we meet at the Hamfest and carpool out from there. From I-84, you can get on highway 55 at exit 35 and go north to Karcher. Go west on Karcher as it zig zags though town until you get to Marsing. from there take highway 95 south to J.V.

I'll contact a truck station there, that Stephanie has talked to. we may be able to fill the balloon indoors.

The weather is still predicted to be nice the day of launch.

Paul

Hi Paul,

Just a note, Basque Station is where the Oregon State Highway shop is and it is much farther south than Jordan Valley.

Looking at the MRF for 60 hours from now, the isobars are widening, so winds aloft are lowering in speed.

We need to find a place to launch from. I've only been to Jordan Valley once. Is anyone familiar with the place?

I've contacted the FAA about the launch. I'll update them as soon as we have a launch site located.

I'll pick up helium this afternoon.

I also have a video tape from Mark Conner. I'll show it at Friday's meeting at DCI.

Paul

Hi Paul,

Jordan Valley is a little tiny bit of nothing in the middle of nothing. There is a small air strip just west of town located at N42 58.812 / W117 04.635 and there are miles of nothing surround the town in all directions. I don't know of an exact location but it would be similar to finding a launch site in the Murphy area. Here are some possible launch sites in the area and distances from Jordan Valley.

Rome Service Airstrip N42 49.829 / W117 37.714 33 miles
Crooked Creek Rest Area N42 47.933 / W117 44.814 38 miles
Burns Junction N42 46.497 / W117 51.044 44
miles
Rome State Airstrip N42 35.029 / W117 52.638 58 miles

Basque Station Highway Shop N42 24.635 / W117 51.767 70 miles

Hope this is helpful. There are probably a hundred other possible launch sites in the area. I hesitate to recommend any others as I have not been involved in a launch and am not sure of all the considerations.

Paul, did you get my email this morning? It looked to me the isobars were getting closer but maybe you were looking at a newer version of the MRF.

As to the launch, I believed we wanted to wait to launch until after the DCI opens. We were talking about 10:00am. We also need to ensure we have communications with DCI from Jordan Valley. Will the 147.20 or the 147.24 repeated reach from there? Any other repeaters we could use from there?

Paul,

I think the burst was expected to be 85,000 ft. You said we would fill with
3 lbs of positive lift this time. Should our ascent rate be 1000 fpm?

John,

Using Street Atlas I picked a spot in Jordan Valley and the lat/lon is
42.97408 -117.0542 in decimal format. I also thought the isobars were slightly
closer. I wonder if Jordan Valley will be good launch point. It depends on what
the weather does. If the balloon wants to go more toward the east then there may
not be good roads to follow. Anybody know this area? Sounds like Stephanie does.
Perhaps after that last hike up the mountain this group can go anywhere! Or not!
I hope Murphy works out as a good launch point. We'll have to see what the
weather brings.

There are roads (some) in Owhyee county but I have never been on them. If we land in a canyon we could have a major issue on our hands. However, I agree with Paul on the isobars. This evenings MFR show the isobars spreading out, totally different than this morning. I will use one of the points tomorrow morning to see where we would land. I do believe there is a major change on the way and Saturday morning could wind up being a guess like the last launch was. Remember, we were predicting a landing in the Mt. Home area. And where did we land?

Oh well, that is the joy of this ......

http://www.arl.noaa.gov/ready-bin/profsrc.pl?metdata=MRF+191+km

Enter the 3-letter ICAO at the top, or the lat/lon at the bottom. On the
next page, select the time you want the forecast for and then the "request
plot" button (leave the rest as defaults). When you get the skew-T display,
you can then select the hyperlink above the graphic and see the text values.
If you save this file, you can import it into Balloon Track for forecasts.

Within 72 hours, you should use the AVN or Eta models at the main page.

Can I get a quick lesson on how to use Balloon Track. I am having difficulty trying to run a prediction. It has been awhile since I have done one when I first got the program, and I forgot how to set it up correctly. Thanks!

Mike,

First go to the TVNSP web site http://www.the-one.com/tvnsp/ . Then click on TVNSP Procedures. Next click on Predicting Near Space Flights. Read the section on Balloon Tracking Software near the bottom. The rest of this assumes you have imported the data to Balloon Track.

Select setup. You should be on the Flight Data tab.
Enter vertical rates. Use 1000 for ascent and 1200 for descent unless Paul tells us otherwise.
Enter burst altitude of 85000 ft. Make sure the Use Burst box is checked.
In the Select Mode box, select Burst.
In the Range and Bearing Computations the first item should be selected.
Measurement system should be Imperial.
Next select the Location Data tab.
Click on Select New Launch Site.
Click on Add New.
You will be at the Add New menu.
For Site Name enter Jordan Valley.
For Latitude enter 42.97408
For Longitude enter -117.0542 Don't forget the minus sign.
For Altitude I chose 2800. I don't know the actual altitude.
Click on Add Site.
You will be back at the Select Launch Site Menu.
Use the Site Name pull down menu to select Jordan Valley.
Click on Activate.
You will be back at the Location Data Tab with the Jordan Valley info filled in.

Click on Save to Default Config File or Close use these settings.
You will be back on the Main Page.
Select View Track to see a plot of the beating and range.
You can export this file to Street Atlas and it will plot the path of the balloon from Jordan Valley.
Next Step - Play with the program.

Hope this helps.

314. Status, 26 April

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-04-26 13:21:03 UTC
From: Paul Verhage
Topic: 314 Message: 314

If launched this morning, the capsule sould set down between J.V and Mt Hopme AFB, south of Nampa. Looking at the isobars, I can see we're getting close to some narrow ones, implying high wind speeds aloft. I felt that yesterday, it looked like the predicted isobars had widened from the previous day, but it doesn't look like that at all now.

Over the next 12 hours the isobars and winds aloft should begin steering towards the northeast. It look like that is beginning now, as the predicted landing point is at 81 degrees, or just north of east.

So by the time we launch, we should expect the predicted landing position to extend and go farther north. If we double the balloon's range and aim it at a heading of 45 degrees, then I think we're looking at a landing site close to Boise. What do you think? The surrent range is estimated to be 34 miles.

I don't want to travel much farther than J.V for this launch, but if we go a little farther south, that will help to ensure the landing site stays in the valley. Now if we could arrange for the capsule to recover in the parking lot of DCI, I'll buy lunch.

Since we're launching after sunrise, we proably shouldn't launch at J.V.'s airport. How about a park or trailhead?

For this flight, I'm using an ascent rate of 1000 ft/min, since we're going to give the balloon 3 ppl. Since the balloon is a 1200 grammer, use a predicted altitude of 90,000 feet. With the extra lift it will lower a bit, but still use 90,000 feet as a worst case scenario.

Tomorrow's prediction should give us a good idea of where we'll recover.

I picked up the helium and had them gauge the tanks. The new tank is at 2500 PSI. Our old tank is at 1500 PSI. Last flight we used approximately 3500 PSI of helium, so we have enough for this flight. We're basically going to bleed the tanks dry.

We need to decide were to meet and when. I'd like to launch bu 9:30, which is a little time before DCI opens. If the surface winds aren't a problem, we can try for a 10:00 am launch. The longer we wait, the greater our chances of having high surface winds. Look outside at 10:00 today. what do the winds look like?

Paul

There should be little to no problem with launching at JV airstrip as it is infrequently used but there will be a number of other places nearby to launch also. The other airstrips I listed are hardly ever used.

316. NWAPRS Gathering

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-04-26 19:44:49 UTC
From: Paul Verhage
Topic: 316 Message: 316

Stepanie notified me that NWAPRS has a conference from September 7 - 9 (Friday to Sunday). I plan to attend and discuss balloons. So I emailed Dave Dobbins and was given an invite. Is anyone interested in attending with me? I'd like to have a TVNSP presence. Just like the St. Joe hamfest I use to attend, I'd like to have several experienced people speak. So how about it?

Paul

The turn to the north is in force. Winds aloft from this mornings launch put the capsule down some 30 miles south of Nampa, if the capsule was launched from J.V. Looking at the 36 hour forecast, it looks like the landing site will be a little farther north, but not much farther away. This may be a relatively easy recovery. I'll run wind reports that Mark dicussed this morning.

We need to meet at the hamfest before taking off to J.V. Plan to be ready to leave the hamfest by 6:30 am. Don't forget we'll meet at DCI tomorrow to set up. I'll be there by 3:30. The Montana Boys (sounds like a gang, doesn't it) plan to be there also. We'll hang around wating for them, if necessary. They have my cell phone number.

Running a MRF for Saturday shows 120 mile/hr winds. The Unisys site however shows we'll be outside the jetstream. Mark, can you take a look at this. Did I do something wrong? The NOAA site displays the winds in meters/second. So I multiplied them by 5 to get a rough speed in miles/hr. (3.28 feet/meter and 1.5 to convert feet/sec to mph).

If the NOAA site is correct, then the capsule will land near Stanely. That's a definite no-no.

I would not recommend a RELAY,WIDE3-3 setting for any airborne APRS setup. You'll QRM a five-state area because nearly every station in the footprint will try to resend the packet at least once. At most, I would enter a single WIDE, especially with a payload that sends out a lot of packets. That may help marginal home stations see the balloon traffic. It may also help with recovery as a well-placed digipeater might hear a packet the chase team may not.

However, the QRM problem is still there, albeit reduced, because the WIDE may be digipeating one packet at the same time the payload is transmitting the next. If the station is question can hear both stations, it probably won't decode either one.

For NSTAR, I used a single WIDE for the unproto setting for the 00-A flight because the demo station in Lincoln did not have a decent antenna but could hear the WIDE digi in town. For subsequent flights I have not used RELAY or WIDE in the path.

Just an observation concerning using WIDE. A single WIDE will cause more QRM than a WIDE1-1 due to every digi that hears it or it's digipeated report repeating it over and over and over and over. A single RELAY command will cause the same problem. The correct path for a balloon would be no path (as it is now) which will not digi anywhere or, IMHO, a WideN-N with a maximum number of hops of 3. All NWAPRS digis support the WideN-N and will only digi the report once. Use of RELAY or WIDE in the path would be a real mess. 73

Topic: 317 Message: 325

The Hamfest is at the Vallivue Middle School south of Caldwell.

Coming from the west on I-84 take the 10th Street Exit (#28) and turn right. Go south about 5 miles, the school is near the top of the hill on the left.

Coming from the east on I-84 take the "Sugar Beet" Exit (#35) and turn right, go to the stop sign by the beet factory and turn left. Take Karcher Rd (Hwy. 55) 5.9 miles to 10th Street. At the stop light turn right. The school is a quarter mile on the right.

For the tech types with GPS's the lat/long of the school is N 43.6087 W 116.6897. For the verbal types the Snake River Club will be running a talk-in on the 147.20 repeater.

Directions to Snake River Amateur Radio Club Hamfest 4-28-01. All mileages are approximate. Repeater 147.20+ (no tone).

Vallivue Middle School (formerly High School) 16358 S 10th Ave Caldwell. Nearest cross streets: Halfway between Karcher Rd (Hwy 55) and Homedale Rd on 10th Ave.

From Boise:
Take I-84 west to Exit 35. At the bottom of the off ramp, turn right (North) onto Nampa Blvd .5 mile to 4 way stop. Turn left (West) onto Karcher Road (Highway 55) and continue for approx 7 miles. Crossing Montana Ave (Gem State Academy) means you'll be turning at the next crossroad .5 mile away. At the stoplight at top of the hill, turn right (North) onto 10th Avenue. You will be able to see the school and football fields from the stoplight. Continue north .5 miles. School is on the right (East). Take the 1st paved road into the paved parking lot.

From Oregon:
Take I-84 east to Exit 28. At the bottom of the off ramp, turn right (West) onto 10th Ave. Continue approx 4.5 miles through town on 10th as it bends south and exits Caldwell. Crossing Homedale Road means you're within .5 mile of the school. At the top of the hill, the school will be on your left (East). Take the 2nd paved entrance into the paved parking lot.

Hope this helps,
Russ

If launched this morning, the capsule would set down about 30 miles south of Nampa. The winds aloft over the next 24 hours will keep close to the same heading, but pick up speed a little. This this case, I'll take a swag and predict the capsule will set down southeast of Boise, perhaps near the southeast corner of town.

I'll run another prediction this morning, when the current radiosonde reports. It looks good for a launch, but we may want to go a little father south before launch.

T-storms are predicted to breakout again this afternoon. I imagine this will be fine for us, since they occur in the late afternoon when instability builds up. Our early launch will avoid them. The latest precip in the mountains has been rain, so we shouldn't have to claw our way through snow again, should we have to go alpine climbing again.

The only questions are will we have clouds in the morning and how long does the wind hold off. If it's cloudy, then I'll remove the IR camera and replace it with a digital. The sooner the winds pick up, the sooner we have to launch. It would be nice to wait until 10:00 am to launch.

I'll call the FAA this morning and let them know we're going south to launch.

Don't forget to bring some munchies and drinks for the chase. And be sure to gas up and visit the restroom before we leave.

By the way, they're called the Bozeman Boys, not the Montana Boys.

Using predicted winds aloft, the capsule will recover 30 miles northeast of Boise, if launched from J.V. We need to drive past J.V. before we begin filling. Another 30 miles on US 95 should be wonders. Stephanie had determined some possible launch sites. We'll look at those. Stephanie, I don't have your list anymore. What looks good to you? I'm going to run a test on Basque Station and see what it turns up.

With the predicted winds for tomorrow, we need to launch between J.V. and Basque Station. That will recover the capsule well within the valley. We need to be ready to leave the hamfest by 6:00 am because it's going to take over an hour to drive to the launch site. But once the capsule lands, it will be much easier to recover it than last time. We'll also be back near Caldwell/Boise.

I'll bring my notes to DCI this afternoon.

Paul

I will not be able to be at the hamfest at 6:00am. I have a friend from work going with us, based on the information from yesterday I told him to meet us at our house between 5:30 and 5:45. I have no way to contacting him today. We would leave no later than 6:00am. Being that, if you leave the Hamfest at 6:00am, we will be between 15 minutes to 45 minutes behind you.

Did you find out if the 24 repeater works in that area? Does the 20 repeater? Any others?

Date: 2001-04-27 18:33:44 UTC
From: Stephanie Steele
Topic: 329 Message: 332

Here they are again. Luckily I had not tossed them yet.

Rome Service Airport N42 49.829 / W117 37.714 33 miles from JV
Crooked Creek Rest Area N42 47.933 / W117 44.814 38 miles from JV
Burns Junction N42 46.497 / W117 51.044 44 miles from JV
Rome State Airport N42 35.029 / W117 52.638 58 miles from JV
Basque Station Highway Shops N42 24.635 / W117 51.767 70 miles from JV

Basque Station is about 70 miles from Jordan Valley so if you are going there plan to leave early. Hwy 95 in Oregon is posted at 55 mph and going much over that is not recommended if you like your cash. Hwy 95 goes southwest out of Jordan Valley and does not go back truly south until Burns Junction. You will be moving your landing spot south and west as you go out of Jordan Valley which should be fine as it would guess that it would have you landing in the area between Ontario and Vale. Jaca Road goes south for quite a few miles just outside of JVand MAY gain you some additional distance south without moving west. I have not traveled that road for years. I believe it should be fine this time of year but I make no guarantees. If you want some south and west movement and want to minimize off road travel look at Rome Service Airport. It is about 33 miles southwest of JV. I think it will give you about 10 miles of movement south.

Hope some of this helps.

Stephanie

Let's plan on launching from Rome Service Airport then, or close to it. If it's just an air strip, then I don't think we'll have a problem launching there.

Anyone familiar with repeaters in that area? We need to coordinate frequencies. If we're out of repeater range, we'll use 146.52. I think we can avoid conflicting with the other event this weekend.

Once back in the valley, we'll use the 24 repeater.

My cell phone is 631-7162 if anyone needs to contact me.

Paul

The quick synopsis is we lost the balloon after the capsules had reached the astonishing hight of 8 feet above ground level.

As we payed out the lanyards in preparation for release, a wind came up wrecking what had been up to that point near perfect calm. We had a struggle to keep the stack vertical. We did get it into possition and released the first lanyard. Then as the second lanyard was released and the balloon lifted off, the lanyard became tangled and severed the load line just below balloon's nozzle.

We are looking to develop a better release mechanism now, and to be prepared to cut the lanyards as needed.

Well, we didn't have to climb the ***** mountains, didn't have any problem finding the capsules after the flight (what - 2 whole minutes??). And we were home by noon. A nice short flight of an astonishing 8 ft. What more could you ask for?

341. Sucker Winds

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-04-29 04:09:28 UTC
From: Paul Verhage
Topic: 341 Message: 341

Have you heard of a sucker hole? That's when there's a opening in the clouds that makes you think it's going to stay clear long enough for you to finish playing. Well, today in Oregon, we discovered sucker winds. That's winds go gentle that you think there will never be another day with winds strong enough to fly a kite. The morning started nice enough with a trip to the local hamfest. There, the launch and chase crews met, discussed, and made plans about where to launch what promised to be a successful mission (don't they all promise?). After about 1.5 hours of travel, we reached the Rome Launch Site (that's what it's called and we have the photos to prove it). There we prepared to launch a nearcraft in the wonderfully calm winds by the river. As usual, it took about an hour to prep the capsule and balloon. And all during that time, we heard nary a whisper of brewing trouble. Just before we were ready to begin raising the balloon, the glider on the capsule was successfully dropped and recovered before we even launched! Isn't TVNSP amazing?! After Mr. Verhage corrected a slight oversight with a servo cable (the blame for this event will be determined at a later time), we prepared for the most important moment, raising the balloon for launch. The tension of the crew as just as tense as the tension on the lanyards, we we let the tense balloon out of our tense hands. But as we raised the balloon on its lanyards, the winds picked up. But these weren't gentle winds that warn you that you had better hurry. Oh no, these were demonic winds that delight in destroying near space stacks. TVNSP crews bravely struggled to save the stack at great risk to themselves. We even continued to raise the stack as the balloon was blown down to within six feet of the ground (I saw the balloon's life flash before my eyes at this point - which is much better than seeing my life flash before my eyes). The first lanyard release was a success and I felt the capsules jump up in the my hands, in preparation of their ascent into near space. Then it was time to release the second lanyard. That occurred as advertised and lifted the capsules completely out of my hands. I felt better now that the worst part was over (if it were only so). But at an altitude about eight feet, the capsules came crashing earthward without so much as the parachute taking notice that it was suppose to open (that slacker). When I looked up I saw the balloon rocketing skyward carrying a lanyard and winder as its only payload ("That's funny", I thought, "that's not what happened last time"). After the initial shock, we discovered that the load line had been cut, severing the capsule and parachute from its ride into near space.

It appears that during the struggle with these demonic winds, the lanyard got wrapped around the load line. Once the last lanyard line was released, the friction melted the load line and pulled the lanyard out of our crewman's hands, giving him severe string burn. The string burn looks very angry and painful. My apologies on this, your first experience with near space.

We decided on a few changes.

1. Everyone near the load line wears gloves, even if they are using the winders.
2. The lanyard ring will now be a part of the load line. There will be no separate lines for the lanyard ring and the load line.
3. Always fill before sunrise and launch ASAP, no waiting to launch late. If the sun's up, we're late.

I want to thank the crews for what they put up with. We were 99% successful. We would have failed 100% if it wasn't for your time and effort. We had an injury that shouldn't have happened. We'll make sure it doesn't happen again.

I hope you can all join me for a launch in two weeks. That flight (TV01C) will carry the 35mm camera with IR film and a camcorder. The goal is to finally shoot IR images from near space and to record a landing. We'll meet again on Friday, May 11 to discuss and plan the launch.

Oh, by the way, I have been selected to be a net correspondent for near space for the Awequest website. I'd like to get info on KNSP and TVNSP flights and send stories to the site. For pictures, I'll need the owner's permission to post them to the site (you'll be given credit). This is an unpaid position (sort of like flying near space capsules) and sounds like a lot of fun. Thanks in advance for any support. To start with, Mark, can I use your picture of Orion? Bill, can I use your story of your successful launch? I'll need pictures of TVNSP's some what successful flight.

Awequest can be found at www.awequest.net.

Paul "Why do I have to learn from my mistakes, rather than someone else's?" Verhage

342. Re: [tvnsp] Sucker Winds

Yahoo group: tvnsp (2000 — 2002)

Topic: 341 Message: 342

(Everyone, please place your tongue firmly in cheek before reading the following)

Hi Paul,

I want to thank you for allowing me to participate in the balloon launch failure drill on Saturday. This has been the second balloon launch failure drill that my work schedule has allowed me to attend and I must say they are really fun. For those who have not had the opportunity to participate yet let me run the event down for you.

Preparation for a balloon launch failure drill always starts with weeks of correspondence via email between all members that are going to participate in the event. I can feel the excitement build as I realize that my work schedule is finally going to allow me to participate and I begin to prepare my tracking equipment. The email crescendo and excitement builds as I attend planning meetings in the weeks immediately before the balloon launch failure drill. I receive word that a good friend and his two young sons who have expressed an interest in participating is going to be able to attend and I know that another convert to the weird wacky world of balloon launch failures is about to be made.

The day of the drill dawns with the promise of what is to come. You either rise hours before the sun rises to begin your trek to the event or as in my case, I get off work at 7 am after working all night. I pile my equipment in the car as I anticipate all that is about to unfold. I know I am way too far behind the launch failure drill team to make it to the launch site but I don't care because even though I won't be there to witness the launch failure, I know that you will be nearby watching the balloon not appear on my tracking screen. I travel for an hour towards the launch failure site and then realize that I have forgotten the one most important piece of my tracking equipment at home. Not to worry, this after all is a launch failure drill and I am showing that I too can foul things up. I turn around and drive almost an hour back home only to discover just before arriving there that I had the equipment in the car all along and had not forgotten it. Cool, I'm in the grove now! I turn around and begin heading back and after doing some quick time/distance calculations I realize that I can not make it anywhere near the launch failure site as I am at least 2 1/2 hours from the site and it is now less than an hour to the scheduled launch failure time. I am able to contact Randy who is one of the most experienced launch failure team members who has been stationed at a special event station at DCI in Boise This station has been set up to allow the public to not watch the balloon launch failure. He has arrived and in the process of setting up his displays he discovers that one of the laptops he is using requires a

password that he does not have. I know the day will be a success now! Unfortunately, Doug, who is another of the team members, who has set up a similar public display at a second site is able to foul everything up and tell him how to bypass the password requirement. This casts doubt in my mind now that the 'winds' of failure have changed and things may accidentally start going right. Randy is able to give me the latest landing projection for the launch failure drill and based upon that information I head for Kuna to not watch the balloon flight.

I can not shake the feelings of dread that keep creeping into my mind because of that positive development but with muted expectations I arrive just prior to the scheduled launch failure time in the projected aborted landing area and begin keyboard communications with the station at DCI to pass the time. The launch failure window comes and goes without any word. I know that word of the successful launch failure is imminent. Several minutes after the latest time that the balloon should have not appeared on my tracking screen I send a message to DCI that I am concerned. Moments later word is received from one of the members at the launch failure site that the event has been a success and the launch has successfully failed! Hooray!

With a sense of relief I head home. I know it will probably be months before my work schedule will again allow me to participate again but I also know that the glow of success of the day's balloon launch failure attempt will be with me for a long time to come!

The end.

****
***

Thanks to Paul and everyone for their efforts on Saturday. It is the positive "can do" spirit of this group that makes it so appealing and fun to work with. Thanks also to everyone for having a good sense of humor about life.

Stephanie

343. ELPH photos and launch ring

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-04-29 16:09:31 UTC
From: Bill All
Topic: 343 Message: 343

Paul and group, I've uploaded several files to your tvnsp file area that hopefully show how I brought the Elph LT's shutter out to allow the Basic Stamp to trigger it. There are 2 screws on each side and one on the bottom. Also the screw in the film canister release needs to be loosened slightly.
The shutter trigger is a 2 step pushbutton. The ground lead is the green wire on the back side of the switch. One of the 2 wires on the front of the switch sets the camera up to take the photo, and the other wire actually takes the picture. The other end of the wires terminates in a Deans Plug that goes to a Radio Shack 5vdc Reed Relay 275-232. I found that by tieing both of the shutter wires together and then shorting them to ground the camera still goes through its setup focusing and trips the shutter.

Also are 2 photos that show how we have adapted your launch release technique. On our flight yesterday after we tied off the balloon we slipped a 3 inch ring over the neck of the balloon before doubling the neck over and tieing and taping it up with duct tape. This seemed to make a cleaner assembly rather than just tieing the ring separately. We still tied the capsule load line directly to the balloon rather than the ring.

The lines from 2 kite handles go through the ring and then just several turns wrapped around the wooden dowels. DO NOT, DO NOT, DO NOT put any kind of a knot on this end. The handlers with the dowel simply hold the line over the dowel to ensure that it does not release prematurely. The handlers with the kite handles let the line out to allow the capsule to clear the ground. On command both handlers with the dowels let the line unwrap and the balloon rises into the air. To date we have not had any problems even in a moderate breeze <10mph.

Don't think anything would have helped in the winds you encountered. Hope that's just an Idaho thing. :-)

Im glad everyone in this group has a good sense of humor. Thats what makes this so fun. Just think if every flight was successful, we would become complacent and probably get bored. We all know that we are supposed to learn from mistakes. I dont see any more reason for failure now, an 8 ft launch, thats got to be worth some kind of record...hi <;) Thats not a failure in my book.

I will continue to attend balloon launches in the future no matter what can happen. Who knows what kind of records we can set eventually. Its all in the name of fun, education and good friends, even if some of you have not seen a full launch yet.
Names witheld because you know who you are...<:)

Paul, were hanging in there with you.

345. Photos of load line

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-04-30 01:17:54 UTC
From: spacedr@yahoo.com
Topic: 345 Message: 345

Paul,

I have had my photographs developed of Saturday's launch attempt, and have scanned in and zoomed in on the loadline/lanyard junction just below the balloon.

The images are as large as 1.6 Mb so I am reluctant to put them over on your files directory here on the tvnsp site for fear of fowling things up (not knowing how much space you have there).

Tomorrow I can get some of the students (infinitely smarter than I at getting images put in a place where people can see them)to make them easily available without tying up your file space.

Interestingly, I expected to have seen 5 lines running to the ground:

loadline,
lanyard#1-up,
lanyard#1-down,
lanyard#2-up,
lanyard#2-down

but only four are visible in several of my photos?

Don't reply to spacedr@... -- I never read mail there. My real email address is klump@...

Paul,

I got a couple questions about the parachute used on the Nearcraft.
First, what are the dimensions of the chute? And second, do you have a
pattern to make one? I have found a website that sells various sizes, but I
am sure they can be handmade for less.....

I use a seven foot diameter parachute. I used a spread sheet to develop the pattern. I still have a cardboard cutout of the pattern that you can use if you want to sew your own.

Paul,

Is there a formula for parachute size versus payload weight to get a particular rate of descent? How did you come up with seven feet for 12 lbs? Anybody know any websites that cover parachute construction?

A formula for parachute size that I obtained a couple years ago (and don't remember where now) is: Diameter in inches = seven times the square root of the weight in ounces. I'm not sure what the decent rate using this formula is, but should give you a good baseline.

Paul's Near Space Capsules weigh a total of 12 lbs. Using this formula his parachute would need to be 8 ft. in diameter. He uses a 7 foot diameter. He also has a hole in the top. If I remember right Paul said the hole in the top is 20% the size of the diameter. I don't remember how long the lines down to the capsule are. The average descent rate is 1200 ft per minute. On landing the capsules are descending at about 20 MPH. This is equivalent to dropping the capsules from a height of 8 ft. Someone check these figures. How many G's is the impact?

I found a formula for landing a payload at 22 fps from an old rocketry magazine. I'll see if my book on recovery systems design covers that.

I may have designed the 'chute for a 10 pound payload (it was so long ago, I
don't recall). So the formula sounds like it will work. The landing speed
is suppose to be slow enough for people, or about 15 mph (22 fps).

Use a spill hole top reduce swaying of the parachute. You can also use a fabric with a higher porosity to reduce swaying, but you'll need a larger diameter parachute.

Hi Paul (everyone),

At 11:00 AM 5/4/01 -0600, you wrote:
>I found a formula for landing a payload at 22 fps from an old rocketry
>magazine. I'll see if my book on recovery systems design covers that.
>

I'd be very interested in seeing what you come up with. I did some rough calculations on what our parachute might do, since it's quite different from yours. We have a 12-ft. parachute from Rocketman (High Power Rocketry Co.), with no spill hole but it does have split wedges on the side for what they estimate would be around a 15 ft/sec landing speed on a 12.5 lb. payload. That means we could be around half the descent rate of yours? If you go strictly by how surface area affects drag, we could potentially see a descent rate of about one-third of yours -- does this sound right?

If this is correct, assuming we did a flight at 6am this morning from Bozeman, here's what we would have:

Descent Rate Landing Site Flight Duration

1200 ft/min 32 miles bearing 91 deg 131 min.

600 ft/min 42 miles bearing 90 deg 166 min.

400 ft/min 52 miles bearing 89 deg 202 min.

We are planning to do some tests with our parachute to determine drag and landing speed. If you go through with doing the same I'd sure like to see your numbers, so we could do some quantitative comparisons. Thanks!

Mike.

This reminds me. During the winter we discussed taking parachutes out to BLM lands for testing. Since I'm leaving in June, perhaps we ought to do that this month. I think Gary was the one with the suggested testing site. We need to tow the parachute behind a truck while measuring the pull the parachute generates. A GPS in the truck will give us accurate speeds.

Can we schedule this for May 19? Doug, do you have a parachute to test? I have four parachutes to test.

Yes, I have one to test. Correct decent rates help in the recovery predictions.

Hi all,

Looking at the forecast 7 days from now it looks like the winds will be from the West. The isobars are close together and the arrows long so the wind speeds will be high. Paul is there a way to tell what the wind speeds will be? Where do we want to launch from this time?

Testing behind a truck can generate some drafting that might cause innacurate testing. It's probably a good idea to have a rather long tether to the chute to help minimize the effect of the drafting.

Paul,

http://members.aol.com/ricnakk/paratest.html

Go to this web site and scroll down to parachute drag testing. I'm sure this test setup can be adapted for a pickup truck rather than a camero. Since balloon parachutes are larger than rocket parachutes we would have to lift it higher to keep it from dragging on the road. If it's held out to the side or above the truck then truck turbulence would be minimized.

372. Re: [tvnsp] Parachute Questions

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-05-06 03:30:30 UTC
From: Jeff Melanson
Topic: 346 Message: 372

Hi John,

I would think we would need a few different speeds in order to graph the results. These speeds should simulate the range of speeds that would be encountered with different payloads. Paul could probably look at past data to see what the landing speed has been. In the reading I've done the desired landing speed ranges from 20 to 30 ft/sec. or 1200 to 1800 ft/min. or 14 to 20 mph. I would think we would want the softer landing but too slow a descent rate can also be a problem. By the way, we use a descent rate of 1200 ft/min for the balloon track prediction program. If the landing is 1200 ft/min then the average descent rate must be higher. Paul tells me that at burst altitude the balloon is descending at 130 mph which is 11,440 ft/min!

373. VIRUS!!!

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-05-06 15:24:37 UTC
From: Mike Garske
Topic: 373 Message: 373

To everyone on this list server, I want to both warn and apologize for a virus that I have unknowingly sent out through my email. I caught it on 5/4, and within five minutes of detecting it, I shut down my PC before it sent anymore. Unfortunately I found that it sent to this list before I could stop it. I just hope I haven't contributed in any extensive or permanent damage to anyones computer. This is the first chance I have had to warn anyone....

Any attachments with the *.scr or *pif extension is the virus, and it is not detected through anyones Hotmail account using McAfee Antivirus. I detected it using Norton AV 2001 and the latest definitions.

Again I am very sorry for this.....

Mike KC7DPD

Attachments: 2 described; binary payloads are missing from this source WARC

Mike,

What files did you send that have those attachments? What does the
Virus do? Would we get the Virus just by recieving your email or do we
have to open the attachments?

Jeff,

I found attachments to your reply to my warning message, did you mean to send those? They were a couple *.gif files....

If you opened the attachments, it activated the virus. It is polymorphic, meaning it changes names and form. Just do not open it! The original name was news_doc.scr.

I looked and I haven't received an attachment from you. Don't know what happened to them but at the moment I ain't complaining..... :-)

I did a fast, dirty calculation from Murphy, it looks like the ballon would land about 12 east of Oreana, about a mile or two east of the Snake River. I used a 1000 ascent rate, 1200 descent and a burst of 90,000. If memory servers me right, we may not be going this high. Paul, what would expect for this flight and what data should we be using for ascent, descent, and burst altitude?

Jeff,

Check your Sent Items for any attachments you have sent, particularly the email sent to the group at 7:02PM today.

I am sure I got it stopped quick, but I checked my Sent Items and had sent 6 emails before I pulled the phone cord out of the wall.....

Mike,

I looked at it and I don't see any attachments. When I sent it my email program asked me if I wanted to send it as HTML or plain text or both. I selected both. I probably should have selected HTML. Could that cause the attachments?

From: Paul Verhage
Topic: 346 Message: 380

Testing behind a truck can generate some drafting that might cause innacurate testing. It's probably a good idea to have a rather long tether to the chute to help minimize the effect of the drafting.
++++++++++++

I have a 100 foot tether to drag the parachute with.

Paul

From: Paul Verhage
Topic: 382 Message: 382

I'll pick up helium tanks on Tuesday. John, can I drop them off at your house? I have a scanner that I'd like to test for the droppler, so if you have a few minutes, I'd like to hook it up while dropping off the tanks.

During lunch I'll start looking at winds aloft.

Paul

383. MRF

I can't go to this site because of the campus filter. It sounds like he recommends raising the parachute above the car. I assume we can do this in the back of a truck (w/o camper shell). We'll need someone to operate the scale, another person to watch the GPS, and a third to record info. Oh, I guess we also need to add a fourth person to drive.

Perhaps we should run the tests from 10 to 20 mph. That will cover the range of reasonable descent rates.

385. UFO Report -- Hello!

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-05-07 17:14:11 UTC
From: Rick Widmer
Topic: 385 Message: 385

Hello, I am Rick Widmer. I was at the MVAS meeting in Twin Falls last month, and I am looking forward to the launch from the CSI campus this summer. I'm sure you will see me then. In the mean time, I have signed up for this mailing list to keep up with what is happening in near space so I can keep MVAS members informed.

Anyway, I saw an interesting item on the Astronomy Discussion Forum you might be interested in. I won't spoil your fun by over-describing it, but I'm pretty sure the initial author was watching a balloon flight when he saw his "strange thing."

390. Virus Alert #2

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-05-08 12:36:40 UTC
From: Jeff Melanson
Topic: 390 Message: 390

Hi all,

Because of Mikes original virus alert I downloaded Norton Antivirus 2001 and checked my computer. Sure enough I had a virus. I don't know if it came from Mike or not. I don't think it did. I don't know how it transmits itself.

Virus Name: W32.HLLW.BYMER

Characteristics:

Polymorphic
Triggered Event
Memory Resident
This one infects EXE files. Norton found it in c:\windows\systems\wininit.exe.
It said the file could not be repaired so it quarantined it.

That's all I know. Go to http://www.symantecstore.com/ and download the try before you buy version. Downloading and setup does take some time. Is there anybody already running antivirus programs that detected anything? Does Yahoo groups check for viruses?

394. Status, 8 May

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-05-08 13:33:46 UTC
From: Paul Verhage
Topic: 394 Message: 394

The MRF predicts winds for Saturday morning to out of the east, southeast. However, they are also predicted to be light. In this case we will launch from Jordan Valley.

I finished the flight code last night. The camcorder switched on like it was suppose to. Its battery was recharged last night sucessfully. I'm currently running a test on the capsule and camera in class today. The capsule is programmed to wait an hour and then start up the camera. I'm concerned about the battery dying while waitning the hour, which is what seems to have happened last time.

No storms are predicted for Saturday, it's just a matter of what the winds decide to do.

For this flight, make predictions using an ascent rate of 750 fpm, descent of 1200 fpm, and max altitude of 70,000 feet.

The next meeting will be held this Friday, same time, same location.

Paul

Walmart is selling the last of their Bearcat 45XLT scanners for $40. If you need to just recieve, for DFing or SSTV for example, youy might want to give one a try. You have to modify the silly antenna connector the scanner has, but that's easy with a Radio Shack BNC chassis connector.

HSC is selling 486 laptops for $129. It's part number HSC#18685. HSC's number is 1-800-4 HALTED. You can see their ad on the first page of Nuts And Volts.

I ran the camcorder at school today. The capsule kept the camera off for one hour and then ran it for an hour. I then shut everything down and restarted the capsule. After running for 30 minutes, the battery had dropped low enough to shut off the camcorder.

Tonight I'll reprogram the flight code to wait 90 minutes before beginning the camcorder recording.

Will the launch be from JV or Rome? Sunrise is at about 6:30. I will be able to help with the launch and should be able to do most of the chase since it is on the way back to the Treasure Valley. If the recovery look's like it will take some time, I'll have to break away to make another commitment later in the morning.

I'm updating the check list, I've got the camcorder, the infra-red camera, and the thermochrons. Are there any other expirements we are running this time such as the insect habitat?

I stopped by D&B Supply the other day to look at possible options for the release mechanism. They have a 3/4" Double Swivel, Koch Industries part #2225. The size is a little small, but I was wondering if there was a larger version. The internal width is .75" which I do not feel is large enough for the lanyards to pass through, the external lenght is 2.75" and width is 1.25". We could tie the balloon to the upper ring and the load line to the lower ring, then protect the lines from being friction burned with a small amount of tape. Here is a rough diagram of it (best viewed with a fixed width font)

```
PPP ^
P P |
P P |
P P |
P n P |
PPPIPPP |
I 2.75"
dddIddd |
d u d |
d d |
d d |
d d |
ddd v

<-1.25->
```

My next thought was magician's rings, but then the magic winds would probably figure out how to get them separated, so maybe not. :)

We'll try to J.V, if the winds remain light

> I'm updating the check list, I've got the camcorder, the
> infra-red camera, and the thermochrons. Are there any other
> expirements we are running this time such as the insect habitat?

Here's the list I brought in this morning (you read my mind).
Connect battery to camcorder
open IR camera
Power up pager
Remove lens covers from camcorder and IR camera
Power up the beacon.

When switching on power, there is two switches in the command module and none in the experiment module. There's one battery in the command module and two in the experiment module (camcorder and beacon).

During nearcraft assembly and test (N/CAT) we need to load the thermochrons (two of them), connect the cabins to ADC ports 0 to 3, connect sounder to ADC ports 4 to 7.

The morning of the launch we need to connect the camcorder to the expansion port and the IR camera to I/O pin zero, which is off by itself.

> I stopped by D&B Supply the other day to look at possible options for
> the release mechanism. They have a 3/4" Double Swivel, Koch
> Industries part #2225.

I know the item you mean. It may work, especailly if we do away with the loop at the ends of the lanyards.

If it looks like the lanyards get twiosted, then we'll have the lanyard ends cut simaltaneously.

I met with the Twin Falls club last night (what a drive). Several of them are interested in helping out. However it is a small club. The Expo center at CSI will be an excellent place to launch balloons from. Very large doors.

Currently the winds aloft are very fast. Over the next 48 hours they are predicted to slow down and turn slightly to the north. I think launching from J.V. will work fine. However I'd like to determine which is further south, Murphy or JV.

If we launched from Twin Falls, the winds would carry the balloon east, and not north.

From: Paul Verhage
Topic: 402 Message: 404

Proably not until after this weekend.

I won't have the time.

Paul

Paul,

J.V. is 30 miles South West of Murphy as the bird fly's.

408. Summary of Pre-Launch Meeting

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-05-12 03:46:45 UTC
From: Jeff Melanson
Topic: 408 Message: 408

Hi all,

We decided to launch from Jordan Valley based on weather predictions. We think the Near Space Capsule will land just SW of Kuna. Any other launch points put the landing sites in undesirable locations. We will meet at 5:15 AM at the corner of Highways 55 and 78 in Marsing. There is a gas station on the SW corner.
We will be using a 600 gram balloon and expect to reach an altitude of 70,000 ft. The capsule will have the following items:
1. A camcorder to record the first landing with clear video. We will turn the camcorder on at 60,000 ft or if balloon burst is detected or 90 minutes into the flight, which ever comes first.
2. An infrared camera. I believe it is set to take a picture every 670 meters.
3. Tempature, humidity, and pressure will be recorded.
4. Two habitats with sensors for internal temperature and pressure.
5. Two thermochrons. (Did I get the name right?) One will measure the temperature inside one of the space capsules and the other will monitor the camcorder battery compartment temperature.
Currently there are only 5 crew members going on this launch. This is bare minimum for a launch. After the launch John Stone will have to depart for another commitment he has in the morning. After that I will have the only tracking station. John Knapp will have the doppler. We really need another crew member to help launch and chase. I need someone to ride along and help operate the tracking station. Is there anyone that can help? You do not have to have prior experience. If you can help just meet us in Marsing. I will check email before going to bed.

From: John Knapp
Topic: 408 Message: 409

A quick check with the ballon tracking program shows a bearing of 74 degrees
and distance of 44 miles. Launched from Murphy it looks like it would land
in the Gowen Field impact area.

I would bet the bearing tomorrow morning would be even further north.
Something to consider in our launch.

From: Paul Verhage
Topic: 413 Message: 413

What a flight. We were able to launch in 45 minutes with just five people. The ascent was windless, although we did have a scare when a quick breeze began.

The landing occured on relatively flat terrain (for Idaho), and took less than an hour. The only thing less than perfect about the landing is that we weren't close enough to see the landing. Thanks goes to Stephanie and Doug for assistance in the recovery. They helped point us to the correct roads. Of course it would have been nicer if they could have been there on chase with us, maybe next time. I didn't get the gentleman's name who told us we could trespass on the gravel road, but thanks for the info.

The GPS stopped putting out a new altitude for about 10 minutes during the descent. But the lats and longs were good. We knew the capsule hadn't landed because it kept moving.

Upon landing the battery in the camcorder snapped lose, but otherwise the battery was located next to the capsule. We only had to walk about 100 feet to get the capsule, and this time it was only 5 feet above the road. After a dusty trip back, we stopped for breakfast/lunch with Dale, who caught up us during the last part of the chase. After John dropped me back off to my car, I checked the camcorder battery. The battery reported a full charge, indicating that it wasn't used.

At home I removed the 35mm camera from the capsule. The camera indicates the film is rewound. We know the camera was working because it took a picture before launch (as I expected). I'll remove the film cartridge after dark and get it developed on Monday. We should have IR pictures of Lake Lowell and other locations, including farms and desert.

Next I removed camcorder from the capsule and tried to replace the battery. The battery won't stay on the camcorder, a little plastic tab on the battery is broken. After two attempts to eject the video tape, I suceeded getting the 8mm tape out. The tape is half recorded! That means 60 minutes of video was recorded on this flight. A quick check of Jeff's log shows the camcorder started 59 minutes before the landing. Folks, it looks like we got a recording of landing.

I can't rewind video tape with my camcorder, so I can't see what we recorded. However it should be of the last part of the ascent, the balloon burst, the descent, and an abrupt cutoff at impact with the ground.

Who has an 8mm camcoder or 8mm VCR that we could use to duplicate the video? I can't find my RCA cables either. Call me on my cell phone (631-7162) if you can help me make a copy of my tape. Once I have that tape I'll make copies for the chase crews and Mark (who I owe a tape). Anyone else can have a copy, just give me a VHS tape.

Thanks for everyone's help.

Paul

The launch site was Succor Creek Jct (a Succor creek is much better then a sucker wind), about 2.5 miles south of the Idaho/Oregon border on US Hwy 95. The lat/long was N 43.23014 W 117.06160 Alt. 4167'.

Paul was the only one with a GPS at the landing site so he will have to provide that data. I wasn't even to Middleton when you said that you were within 100 yards of the landing site, I wish now that I would have stayed with you until then.

When I contacted you on your way to breakfast, my battery was dying thats why you would only catch one word. (Note to self - Add power adaptor to shopping list.)

Does anyone have the names/call signs of the two gentlemen who assisted in the chase, the one who met us in Star, and the one who road his ATV out towards the landing site? I would like to record their names in the crew log for this flight.

From: Paul Verhage
Topic: 417 Message: 417

The camcorder recorded the sounds of the flight, but no images. It's a blank screen. I'll have a tech look at the camera. By the way, I need to review a tape I made during a ground test, and see if that was recorded.

Our max altitude was 66,990 feet, a little lower than I was expecting.

I'll drop off the IR film tomorrow after school, just after I dump that clanging tank of helium.

Paul

418. Flights TV01C and TV01D

From: Paul Verhage
Topic: 418 Message: 418

The IR film is at the processors. I'll know this afternoon how it went. The camcorder does record the camera operating during the flight, so I imagine we'll get the IR pictures. The last image is positioned over Lake Lowell, near 66,000 feet. It will proably show all of the lake and Nampa.

I finished editing the flight log. We're missing the first nine records and preflight data. Jeff, do you have a copy of this? If anyone would like a copy, send me email and I'll forward you a copy. Tonight I'll work on getting the log into a spreadsheet.

The TV01D flight is having a conference tonight. I'll fill you in on the details tomorrow. If anyone is interested in helping with the launches in Kansas (30 June), let me know. The flights will carry a copy of the Hitchhiker's Guide to the Galaxy in memory of Douglas Adams who passed away last Friday. The book will be signed by launch and chase crews before going up to around 90,000 feet. Afterwards the book will be returned to one of his fan clubs in England.

Paul,

I was holding the balloon when the capsule was turned on. You and John Stone checked APRS but no one turned on the TNC logging. I turned it on after we launched the near space craft. This needs to be added to the checklist.
Did you get the ascent rate and Descent rate? I'm especially curious about how fast the capsule was descending when it meet the Earth.

422. June Launch

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-05-16 15:27:59 UTC
From: Paul Verhage
Topic: 422 Message: 422

If anyone is planning to be vacationing near Kansas on 30 June, we could use some help with the four (and possibly five) balloon launches we're planning that morning. Talk about getting lots of launch experience in a short time!

Paul

423. Re: Flights TV01C and TV01D

From: k7jps@arrl.net
Topic: 418 Message: 423

I would like a copy of the TV01C data log if you would forward it to me at k7jps@....

I do have a line in the check list to turn on the APRS log, but we were too busy with the balloon to get to that until after launch.

I will be out of town this weekend, so if you are planning to do any parachute testing, I will not be able to help.

424. TV01C, first finding

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-05-17 19:57:21 UTC
From: Paul Verhage
Topic: 424 Message: 424

I've just started processing data on the spreadsheet. My first finding is that the pressure in the crushed cabin didn't leak out during the entire flight. Both cabins slowly leaked a little pressure, but nothing too bad. At around 50,000 feet the crushed cabin failed catastophically. In about 2.5 minutes it leaked to ambient pressure. The other cabin held up just fine.

Is anyone taking a June vacation near Kansas? We could use some help with the 30 June launch.

Paul

425. NSTAR balloon flight Saturday, May 19th

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-05-18 03:34:17 UTC
From: Mark Conner
Topic: 425 Message: 425

Nebraska Stratospheric Amateur Radio (NSTAR) will fly an amateur radio balloon payload on Saturday, May 19th. Launch time is scheduled for 8am CDT (1300 UTC) from west of Omaha, NE. APRS will be on 144.39 and a simplex repeater on 446.10 MHz. Range of the simplex repeater should be up to about 350 miles. Callsign will be N9XTN-11 and positions will be on FindU at http://www.findu.com/cgi-bin/find.cgi?n9xtn-11 . A camcorder will also be flown, which will record video and audio from launch to perhaps halfway into the descent.

Maximum altitude will be about 90,000 ft. Total flight time will be about 2.5 hours. For the lastest, see the KNSP list at http://groups.yahoo.com/group/KNSP .

426. Last Flight

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-05-19 18:53:40 UTC
From: Paul Verhage
Topic: 426 Message: 426

I've updated the webpages for the last flight. under Other Products is the flight log and spreadsheet.

I need copies of any pictures taken during the flight. Let me know how much they cost you to duplicate. I'll add them once I've scanned them.

Paul

427. NSTAR is now 3.5 for 4

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-05-19 20:31:47 UTC
From: Mark Conner
Topic: 427 Message: 427

The video camera and simplex repeater fell off.

We noticed during the descent that the simplex repeater was no longer working, but didn't think a whole lot about it. Maybe the batteries died, or a connection came loose (I was having a few problems with it). When we picked up the payloads, we were one short.

I was using metal fishing line clasps (can't think of the proper name) to attach the payloads to the spreader ring for the parachute. The clasp used to attache the camcorder/simplex repeater package was completely gone. The load line for the bottom telemetry package was routed up through a wire tie on the back of the camcorder package, so that wire tie had to break too for the package to fall free. It's not difficult to believe that that wire tie failed in the cold. It was probably fortunate that the camcorder package didn't take the telemetry package with it when it went.

The last successful transmission through the simplex repeater was at 1449 UTC, which could easily have been as it was falling to earth. At that time, the balloon was near Mineola, IA at:
N9XTN-11>APRS:/144917h4109.25N/09540.85WO099/013/A=054777 3D07Sats -2421FPM NSTAR 01B Smplx Rptr 446.1

After recovery, the chase team drove around this area, hoping to bring up the simplex repeater. No luck. My guess is that the video camera is ruined, the simplex repeater unit is cracked but may work. The VX-1R and the camcorder's battery should be salvagable if the package can be found. Impact velocity was probably around 125 mph.

On the good side, the rest of the flight went well. The simplex repeater was a big hit, both figuratively and then literally. Max altitude was just over 95,384 ft, the highest NSTAR flight. We should have a long-distance QSO recorded between Sioux City IA and Joplin MO, or about 380 miles.

The container that departed the formation was the first NSTAR capsule, which had made about eight flights total. RIP. (Rest in Pieces)

More later after a beer and some data analysis. E-mail any logged data if you have it - thanks.

I think you're referring to a snap swivel. I wish I knew you were using one. On my first ablloon attempt way back in 1996 we used one. It broke free, letting the balloon take off sucessfully, but leaving me with a grounded capsule.

> It's not difficult to believe that
> that wire tie
> failed in the cold.

Is this a nylon wire tie you're talking about?

I wonder if the payload broke free when the balloon burst. Some of the KNSP video shows it can be pretty rough.

> Impact velocity was probably around 125 mph.

Ouch.

I'm sorry to hear about the failures. Your description made me smile, thanks. I try to keep a positive attitude when my flights fail, and sometimes it's a difficult thing to do.

If you can recover the video tape, it ought to be pretty awesome. I imagine it would land a little downwind from the burst point.

I have a class in Florida in July and won't be able to launch until the last week in July. Can we do the ATV flight in Twin on the 28th?

It will be another two weeks after that before the meteor flight.

While in Florida I have three days to spend on my own events. I plan to spend one of those days at the cape.

Paul

Paul,
You might be a bit wary of something priced like this. My guess is that they just run the magnetic media thru an inkjet printer, and environmental exposure to the inks will fade them REALLY fast.

437. Chase Song

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-05-31 13:23:28 UTC
From: Paul Verhage
Topic: 437 Message: 437

While, occasionally, working on my book, I try to develop top ten lists. One of the lists is songs to play while doing balloon chases. One of the songs I selected is Willie Nelson's "On The Road Again". Well, to be a little more creative, I decided to "fix up" the lyrics. Here's what I have.

On the road again
Just can't wait to get on the road again
My best time is near space chasing with my friends
And I can't wait to get on the road again

On the road again
Driving roads that I've never been
Searching fields for what I'll never find again
I can't wait to get on the road again

On the road again
Looking like the X-Files we drive down the highway
We're the best of friends
Predicting that the stack is drifting our way
And our way.....

Is on the road again

Okay, so perhaps I shouldn't give up my day job.
I'll work on it some more this summer. I still need to work on the second half.

Paul "Part time song writer" Verhage

443. The Bozeman Group: First Launch!

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-06-08 17:55:54 UTC
From: Mike Murray
Topic: 443 Message: 443
Attachments: 1 described; binary payloads are missing from this source WARC

Greetings Paul and everyone in the TVNSP group,

I just wanted to let you know that the new Balloon group at MSU-Bozeman had its first successful balloon flight yesterday! As some of you know, this is the new program started by the Montana Space Grant Consortium, now called BOREALIS ("Balloon Outreach, Research, Exploration And Land Imaging System").

Our test flight was a great success! The launch was from the airport in Big Timber, Montana (between Bozeman and Billings) at 5:57 am MDT. We used a 300g balloon, complete with digital camera, HOBO, radio, GPS, and UHF repeater. Probably the most well known amateur radio enthusiast in the state, Bill Erhart (K7MT) from Helena, assisted on this flight. His repeater allowed us to post our APRS packets over the APRS website, and HAMS all across Montana (and beyond) were watching the flight. We heard people talking on the radios about the flight all the way home to Bozeman!

We thought we had the right amount of lift in the balloon, but it only ended up rising at around 370 ft./min! However, we still made it to 45,341 feet, and landed east about 102 miles, north of Hardin, Montana, at 8:05 am. We recovered the payload about 90 minutes later.

This test flight carried with it a digital camera called IBIS ("Integrated Balloon Imaging System"), which returned 267 pictures from the 2 hour flight. You can see selected images taken by IBIS at:

http://physics.montana.edu/borealis/IBISbor0106A.html

Pictures of the launch and recovery operations will be posted soon, but I've attached one to give you an idea.

Our flight data is available at:

http://physics.montana.edu/borealis/bor0106A.html

If you would like more information about the BOREALIS project, how it works, and what's in store for the future, start at our main homepage:

http://physics.montana.edu/borealis/

MANY thanks to all of you who have been so nice to us and giving of your time to help us get started with this project. We couldn't have done it without you!

Mike.

What type of cables did you loan out? I do not show any growth in my inventory
of
cableing. Was it for the SSTV setup maybe?

All i can say is Wow!!

Congratulations gang, your homework really paid off.
The pictures were really nice. Loved the Yellowstone River shots.
Keep up the good work and keep on havin fun.

I gave them to John Stone for use at DCI. I believe they are RG-(5?)8U (thin cable). There were three rolls, either 50 ft or 100ft per roll. They were terminated with right angle connectors. (They were previously used in a lan at work - I salvaged them for possible use at home.)

I have uploaded some video clips from NSTAR Flight 01B to my web page at http://members.home.net/mconner1/nstar.html . They are about 350 kbytes each and are therefore not the best video quality. I'm working on some alternate storage for higher-quality clips.

If someone has Netscape 6, let me know how the page formatting is rendered. I know some of the formatting FrontPage 2000 does can really trash the display in Netscape 4.x or earlier.

Paul,

How about some details on the July 28th launch. Are we planning to launch early Saturday morning as usual? Is anyone going over the night before or very early the same morning? How and where do we meet up with each other? I tentatively plan to go on this launch and Ray "Don't burn my hands again" Silvia is coming with me. We are also looking forward to the night launch.

From: Paul Verhage
Topic: 455 Message: 455

I'll be at the club meeting tonight (Snake River, at Idaho Pizza in Caldwell). I will bring a video tape of Mark's last flight. It's a good video with an interesting end.

I'll be back on July 11. The weekend after we'll have a meeting at Idaho Pizza to discuss upcoming flioghts and a plan for this winter, during the off-season. The plan is to launch a test flight from Twin on the last weekend of July to get them some practice. Lee was able to track the flight using APRS from the Twin Club's radio van. August 11 is still the planned date for the big launch. Both Twin flights will be from the Expo Center at CSI.

There will still be a flight in autumn that will be a pleaser for fox hunters.

Paul

Greetings from Bozeman!

Our second flight for the Montana Space Grant Consortium's BOREALIS project went off on June 30 from the Big Timber airport. We flew a 1200gm balloon with a prototype of the MEROPE satellite (geiger tube system), temperature sensors, and a digital camera. Our highest APRS packet registered 86,233 feet. Data and photos are still in the process of being posted to our website:

http://www.physics.montana.edu/borealis/bor0106B.html

Attached are a couple photos from the flight that I thought you'd like to see (low-res):

75.2k.Yellake = A view looking SW from 75,200 feet over Laurel, MT (near Billings) clearly shows the black sky above, the blue layers of the atmosphere, and the curvature of the earth. The Beartooth Mountains are in the foreground, with Yellowstone Lake (including West Thumb) in the background. The Tetons are behind and left of the lake.

Max.Alt = At around 86,100 feet, this is the last shot before burst. There are clouds on the horizon, but you can still see some evidence of curvature.

What a blast!!

Mike.

From: Conner, Mark
Topic: 458 Message: 459

From the Borealis web site:
<start>
Near the final BOREALIS landing site, we recovered a fragment of the burst latex weather balloon. As far as we know at this time, this is the first time such a piece has been recovered -- the standard folklore which we had believed was that the latex becomes very cold at altitude, and when it in fact finally bursts, breaks into tiny fragments.
The piece we recovered is quite massive (*** g), knotted quite tightly (we don't understand this yet) on one end with the other end flapping free so the whole piece looks like a Halloween ghost, and roughly a meter long in the "knotted configuration" it was found in. Many thanks to Ms. Kathie Martin of Billings, who saw the fragment fall on her property and told us about it. What time the fragment landed is unknown.
<end>

I have two of these from NSTAR 01-B and 01-D that came back like this, but still attached to the balloon neck. Paul has one also from the past weekend's GPSL flight - all were 1200g Kaymont balloons. The two 600g envelopes I've flown did not do this. So the phenomenon is not unknown, but it's unusual to retrieve one and not have it be attached to the payload in some fashion.

I think what happens is that the shards tangle before they contract, but I don't have any direct evidence of this. Maybe I'll fly a video camera pointed vertically to see this phenomenon.

You can see some of what happens with balloon bursts by viewing these two movies:

http://www.ksu.edu/humec/knsp/98bvid.htm
http://members.home.net/mconner1/movies/NSTAR01B-burst.rm

Topic: 460 Message: 460

I have uploaded a couple of pictures showing the knotted remains of a 1200g balloon from the NSTAR 01-B flight earlier this year. Are these similar to what BOREALIS got back over the weekend?

http://groups.yahoo.com/group/tvnsp/files/Balloon%20remnants.jpg
http://groups.yahoo.com/group/tvnsp/files/Balloon%20remnants%20closeup.jpg

The remnants weigh about 900g, or about 75% of the original.

Paul,

Since I have never been to a meeting before, can you tell me where and when it is again? Thanks!

Mike KC7DPD

467. Next TVNSP Meeting

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-07-12 20:59:55 UTC
From: Paul Verhage
Topic: 467 Message: 467

We'll hold a TVNSP meeting this Saturday, at Idaho Pizza Co. in Caldwell.
I'll reserve a space for 6:30 to 8:30.

Items to discuss...
My vacation (the balloon related parts, that is)
The next three launches
A few plans for next year

Hope to see you there.

Paul

Paul, I am passing along the following message for John Knapp...

Jeff, I cannot get to the group server nor can I change my email address
to
send this reply. Let Paul know we will not be able to make the July and
August launches but will try to be at the meeting Saturday.

I would appreciate the help - this change of email address has be going
around in circles.

Thanks
John Knapp

Sounds like this will be a good meeting with all of the responses coming in, and the videos you plan to show. Sorry I'll be missing this one, but it shoul be much cooler in the mountains this weekend.

Will we be having another meeting before the July 28th launch? I am planing on making both of the Twin Falls launches.

I got Jeff's message from John Knapp. I can't get to egroups at the campus, I may have to borrow someone's PC at home. we may be able to work out something on egroups for John.

I picked up two strobes that U of Wyo uses for their flights and will bring them to the meeting. Jeff, I'd like to compare these strobes to those used on aircraft. I'd like to compare their brightnesses.

Sorry that John Stone can't make it to the meeting. We'll catch you next time.

I'm off to a class on Monday and will be back on the following Monday. At the meeting we'll schedule the next couple of meetings. Please bring a calendar.

472. July 28th Launch

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-07-15 04:01:24 UTC
From: Mike Garske
Topic: 472 Message: 472

Everyone,

I am sending this as a reminder to everyone on behalf of Paul, he is out and about criss-crossing the U.S. for the next couple of weeks. There is going to be a launch in Twin Falls on Saturday, July 28th at 0600hrs. It will be held at the College of Southern Idaho (CSI) at the Herrett Center. This launch is to serve as training for the Twin Falls area hams for the next launch on August 11th. The main concern for the July launch is finding suitable accommodations, like nearby hotels and such. If anyone has any info on the logistics, or any questions on how to get there, post it to this group.

Thanks,

Mike KC7DPD

Hi Everyone,

For those of you who are planning to arrive in Twin Falls on Friday night (the 27th) here are some hotel options.
Motel 6 is 1/2 mile from the college. It is on the corner of Falls Ave and Hwy 93. Exit 173 and drive south about 3 miles and you're there. The college is West on Falls Ave. The price is $46.00 for a room for 1 adult. I plan on making reservations here. Go to http://motel6.com/ and find Twin Falls, Idaho.
Super 8 Motel is about one block north of Motel 6 on the corner of College Ave and Hwy 93. From there the college is about 1/2 mile West on College Ave. The price is $56.00 for a room for 1 adult. Go to http://super8.com/ for reservations.
If you have a VIP card the price is cheaper. Best Western is $60.00 and farther away from the college.
The Falls Ave road will put you on the south side of the college. College Ave will put you on the north side of the college. Which side did Paul say the launch would be on?
The Twin Falls repeater is 146.760- (minus offset) and is an open repeater. This repeater belongs to the Magic Valley Amateur Radio Club. Perhaps someone should contact them and let them know about the planned event.
For those of us that will be running Balloon Track the launch point Lat and Lon are from Street Atlas in Decimal format: Lat 42.58333 Lon -114.47417 (Don't forget the minus sign) Altitude ~2100 ft.

Hi, I am Rick Widmer, a member of the Magic Valley Astronomical Society, and a resident of Kimberly. (5 miles from Twin Falls) I am watching this list, and will answer any questions about the area posted here.

As to lodging the following are within a mile of the launch site. (unless noted.) Listed in no particular order.

AmeriTel Inns 736-8000
Weston Plaza 733-0650
Days Inn 324-6400 (At the freeway exit)
Super 8 734-5801
Shilo Inn 800 222-2244
Motel 6 734-3993
Cavanaughs 734-5000

If you are looking for food, just cruse Blue Lakes Blvd for a wide assortment of resturants and fast food.

Rick

The North College Drive entrance will be a better choice. The launch is at the Expo Center, the first college building you will see as you approach from Blue Lakes Blvd. As you drive South on Blue Lakes Blvd look for a resturant called Tomatoes on the right side of the road. North College Drive is the road right after it. There is no stoplight.

If you go too far, the next stoplight is Falls Avenue. To get to the Expo Center from Falls Avenue turn Right after the Fire Department. Look for the National Gaurd Armory sign. Go past the armory to the expo center. There is plenty of parking at the Expo.

479. T-Shirts

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-07-23 18:16:44 UTC
From: Paul Verhage
Topic: 479 Message: 479

I have a design and cost for t-shirts. For sizes up to XL, they'll cost $10.25 a piece, if we order 24 of them. I'll order several to make up the the balance of the order, but will need at least 12 ordered. The TVNSP logo will be on the left chest and the text, "Let's Do Launch" will be on the back. I'll send everyone's t-shirt up on a flight.

The extras I'd like to use as trade items. Mark, Biil, and Don, if your groups will create a logo and t-shirt, I'll trade you one of ours for one of yours.

If you'd like to order a t-shirt, please email me with quantity and size.

Paul

From: Paul Verhage
Topic: 481 Message: 481

I'd like to begin planning for the Great Plains super launch in July 2002. We'll launch around the 4th of July weekend in Manhattan, Kansas. We have a huge indoor launch site to fill balloons inside. The plan is also to hold a mini-sympoisum for this launch. I need to find out how many groups we can get involved and how many balloons will be launched.

The symposium side of it will probably be held at K-State. I'll contact the Physics Department about reserving a location.

Please contact the KNSP listserv with comments or questions.

Hope to see you in 2002.

Hi All,

I went to the atmospheric soundings page http://www-das.uwyo.edu/upperair/sounding.html to get data for balloon track but the data is 6 days old! There is a note that says there will be a new interface starting September 1st. Anybody know what's going on here?

Paul, have you looked at the Medium Range Forecast yet? What is your prediction?

For those of you spending the night in Twin Falls don't forget to make your reservations.

Any thoughts on a pre-launch dinner on Friday night? Maybe we can meet Rick Widmer and other Astronomical Society members the night before the launch.

SUBJECT: [tvnsp] T-Shirts

I have a design and cost for t-shirts. For sizes up to XL, they'll cost $10.25 a piece, if we order 24 of them. I'll order several to make up the balance of the order, but will need at least 12 ordered. The TVNSP logo will be on the left chest and the text, "Let's Do Launch" will be on the back. I'll send everyone's t-shirt up on a flight.

The extras I'd like to use as trade items. Mark, Biil, and Don, if your groups will create a logo and t-shirt, I'll trade you one of ours for one of yours.

If you'd like to order a t-shirt, please email me with quantity and size.

Paul

The upper air station id to use on stormchaser's site for the Southern Idaho area is KBOI. I haven't run any predictions yet, but the MFR looks stable for the last half of the week.

If someone in the Twin Falls area can recommend a restaurant we can meet at for the Friday evening meeting, that would be good. I can be there at 5:00 pm, but some of the rest of you from the Boise area might not be able to make it as early.

Paul, if there is anything you need me to transport, I'll be taking my pickup, and would be happy to help.

I talked to Dr Deshler at U of Wyo, who puts out the atmospheric soundings. I let him know the data is very popular with the ballooning community. I'll send email asking about the change. There's a hidden link that I was shown, that may be useful to us. I'll ask if we can use it also.

I was going to look at predictions today, but the new teacher erased all my URLs. I'll see what I can find. If nothing eles, we'll contact the Boise NWS.

I want to get a dinner together for Friday. We'll hold the first lesson there. I'll ask Rick for suggestions.

I ran the balloon track software using launch site of N 42.5836 W 114.4666 Alt 2100' Ascent rate 750 fpm, burst at 70,000', decent rate 1200 fpm. With the 7/24 12Z data it had a max wind of 33.4 mph bearing 10 deg at 35,433 ft. The landing site was W 42.3238 N 114.1777 flight time was 121 minutes bearing 140.5 deg range 23.2 miles.

Is there anything I need to adjust in the ascent/decent rate or the burst altitude?

This landing site was near Rams Horn Ridge in the Sawtooth National Forest. Looking at the MFR for Saturday the winds should be more from the west so I would not expect the balloon to go so far to the south. Thursday winds should give us a more accurate prediction.

We will meet at The Mongolian House around 6:30-7:00 PM for dinner and to discuss the launch.

The Mongolian House is at 180 Blue Lakes Blvd North, almost 2 miles south of Falls Avenue. (The southern access to CSI.) Look for it on the left if you are southbound, just before the 5 points junction with Addison Avenue. Plan on spending about $10 for the dinner special. If you need to call them the number is 736-2882.

Hi all,

I just ran the tracking software with 7/25 0Z data. My Lat and Lon are 42.58333 and -114.47417 Altitude 2100 ft. Ascent rate 1000 fpm, descent 1200 fpm, burst at 85,000 ft. Under these conditions the capsule would follow the freeway east. Just before reaching Hazelton Municipal Airport it would turn around and come back west until it burst over the freeway. The capsule would then proceed east again and pass directly over the airport. It would then cross over to the south side of the freeway and touch down would be 2 miles SE of the airport. We would be there to see it. The predicted landing site is 19 miles east bearing 094 degrees from the launch site. Of course things can change a lot by launch time. Paul (not enough helium) Verhage what will the planned ascent rate and burst altitude be?

Jeff Melanson

I need to get to Twin earlier. I'll be running a test with the radio club on APRS. I'll need about an hour to do this. Dinner will begin around 6:00 PM. So if I get in by 4:00, that should work. This means I need to leave by 2:00.

Paul

So far, I have orders for 9 t-shirts. Once I get three more, I'll order them. Before I do that, I'll post the number and sizes that everyone ordered, for confirmation.

I'm still waiting for the balloons to arrive. I'll double check with UPS, but they should be here before Friday. My first package arrived yesteday, so that's a good sign (they were ordered together)

Bozeman is having a launch in late august. I plan to attend. Is anyone else interested in going?

After dinner on Friday we'll teach the civilians how to become near space crew members. The movie, planets of the Apes opens that night. I may try to see it after the dinner and class.

Launch is bright and early on Saturday. Fill time begins at 5:00 AM. Launch at 6:00. If we have to cancel, I'll still hold the lesson, but move the launch to the following weekend.

The capsule is ready to go. I'll pick up the IR film this afternoon.

for flight predictions, it looks like the closest NWS station is still Boise. I can't get into the MRF site to look at predicted winds, but yesterday, they where predicted to be from the west.

Paul,

That Lat and Long would put the launch site at the corner if Wash St.
and Filer according to Street Atlas. That would be 1 mile S-SW of the
College.

I used the following:
Lat 42.58333
Long -114.47417
Ascent 800
Descent 1200
Burst 80,000
Alt 2100

With these parameters the capsule would land 26 miles away bearing 080
degrees.
The sounding data was 7/25 12Z.

The MRF looks like the winds will be from the West on Saturday Morning.

Paul,

Okay, Let's make it 2:00 P.M. Will that work for you John? Do you want to meet somewhere? Stephanie said she and Norma will be arriving Friday night.

Here are some things for everyone to remember:

Twin Falls repeater is 146.760- (minus offset).
Call Signs, crew members, and guests:

Balloon KD4STH-11
Paul KD4STH
John Stone K7JPS
Stephanie K7DBA
Jeff KD7INN
Ray Silvia Crew Member
Norma Crew Member
Rick Widmer Astronomical Society

Pre launch dinner meeting: (Recommended by Rick Widmer)

The Mongolian House is at 180 Blue Lakes Blvd North, almost 2 miles south of Falls Avenue. (The southern access to CSI.) Look for it on the left if you are southbound, just before the 5 points junction with Addison Avenue. Plan on spending about $10 for the dinner special. If you need to call them the number is 736-2882.

-Lodging Info provided by Rick -
As to lodging the following are within a mile of the launch site. (unless noted.) Listed in no particular order.

AmeriTel Inns 736-8000
Weston Plaza 733-0650
Days Inn 324-6400 (At the freeway exit)
Super 8 734-5801
Shilo Inn 800 222-2244
Motel 6 734-3993
Cavanaughs 734-5000

If you are looking for food, just cruse Blue Lakes Blvd for a wide assortment of restaurants and fast food.

Oops, I wrote earlier that I thought you were driving down Friday Night.
My mistake.
Will you be traveling with us or show up later? I don't know where we
are meeting yet but it looks like we are leaving no later than 2:00 P.M.

Paul,

Frank (AC7BF) and myself (W7AFM) have a gateway working here in Boise now. The APRS freq. is the same 144.390 and the HF freq. is 10.150.50. When the conditions are right we have been getting into the east coast and just about all the lower 48 states and into Canada. If your team team wants to use our gateway directly the alias is REDNEK. If Frank or myself can be of any more help just let us know. Good luck on your next flight.

73s de Bob W7AFM

516. Finally

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-07-26 03:26:05 UTC
From: kd7hgs@yahoo.com
Topic: 516 Message: 516

I finally am able to go to the group page. Please notice I have a change of email address, I will be using my call sign, kd7hgs, at yahoo.com for email for this group.

Due to a commitment made earlier this month I will not be able to attend the launch this Saturday. However, as plans changed recently, we will be able to attend the night launch in August.

Paul, thanks for visiting with me on the phone the other night. You don't have to worry about getting me set up on this list server again.

Am wishing you the best Saturday. Sounds like the winds will be cooperating with you. Hope they stay the same as they are now - calm and peaceful.

JohnK - KD7HGS

517. RE: [tvnsp] Status, 25 July

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-07-26 05:31:12 UTC
From: K7JPS - John
Topic: 505 Message: 517

I spoke with Paul this evening and he wanted this info passed on:

The 1000 g balloon arrived today so the only thing he is waiting for is batteries which he is expecting Thursday, if they don't arrive he does have enough on hand for this flight

He will be bringing a book on ballooning procedures for new crew members that he has developed.

For any non-licensed crew members that have scanners to monitor the chase, we will be using the Twin falls repeater on 146.760 MHz with backup on simplex at 146.52 MHz.

If the Astronomical Society has bumper stickers or fliers they would like to fly, bring them along and Paul will place them in the launch capsule.

The manifest for this flight will include:
3 Cameras, B&W Infra-red, Digital, and 35mm with color print film.
4 test tubes of radish seeds, 2 inside the capsules, 2 outside.
2 insect habitats
Environmental sounder (air temp, air pressure, relative humidity)

I cross referenced a map of CSI's Expo center with SA and came up with a lat/long of N 42.5836 W 114.4666. Based on Paul's Ascent/Decent and Burst info, using the 7/26 0Z data from Boise, the predicted landing site is 31.1 miles at 74.9 deg. at N 42.6991 W 113.8756 flight time of 130 minutes

Subject: [tvnsp] Status, 25 July

So far, I have orders for 9 t-shirts. Once I get three more, I'll order them. Before I do that, I'll post the number and sizes that everyone ordered, for confirmation.

I'm still waiting for the balloons to arrive. I'll double check with UPS, but they should be here before Friday. My first package arrived yesteday, so that's a good sign (they were ordered together)

Bozeman is having a launch in late august. I plan to attend. Is anyone else interested in going?

After dinner on Friday we'll teach the civilians how to become near space crew members. The movie, planets of the Apes opens that night. I may try to see it after the dinner and class.

Launch is bright and early on Saturday. Fill time begins at 5:00 AM. Launch at 6:00. If we have to cancel, I'll still hold the lesson, but move
the launch to the following weekend.

The capsule is ready to go. I'll pick up the IR film this afternoon.

for flight predictions, it looks like the closest NWS station is still Boise. I can't get into the MRF site to look at predicted winds, but yesterday, they where predicted to be from the west.

518. APRS Path

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-07-26 05:41:12 UTC
From: K7JPS - John
Topic: 499 Message: 518

I spoke with Paul, he has not changed the APRS path on the balloon from it's previous setting and being so close to launch time he is not sure that he wants to take it apart to get to the TNC and make the changes.

We'll see what our signal path is like on Saturday, and then make changes for the August 11 flight.

From: Paul Verhage
Topic: 519 Message: 519

Mark's report shows alot of the winds coming from the west-soutwest. So the balloon should recover to the east-northeast. The winds look light, so we shouldn't have to chase very far. I'll buy lunch for whoever manages to catch the balloon upon landing. Watch out for the antenna, though, I won't pay to have your eyeball replaced. Bring cameras and a camcorder, as we may get good images of the landing.

I have the balloons for the next two flights. I've also got a set of batteries, but should get another box today. I have two tanks of helium in my Jeep. I'll also bring the partial tank with me (actually, John Stone well). I'll load the film into the cameras tonight. We'll be shooting B&W IR along weith color. I erased the memory in the digital camera, so it's ready to shoot 160 pictures. That camera is mounted on a scanner, so it will focus on taking pictures of the horizon, balloon, and parachute.

Can anyone run a prediction on Friday night or Saturday morning?

The first stop once we're in Twin needs to be the Herrett Center. Afterwards, I need to check in with Lee and test the APRS telemetry with him. Lee will have the Twin Comm Van with him for the flight. I'll be at the Eagle exit by 2:00 PM, Friday

If you're not a licensed ham, but do have a scanner, tune it for 146.7600 for most of the chase and recovery. Towards the end we may have to change to 146.5200.

I have orders for 10 t-shirts so far. Once I get two more, I'll order them. Remember the prices are $10.25 for any size up to XL. After that, add an additional $2.00 per extra X. If you'd like to personalize yours, with your name, that's an additional $3.00.

Alright gang, it looks like we're ready to go. Let's train some civilians.

From: K7JPS - John
Topic: 516 Message: 521

I'm bringing my laptop with me so that I can run a prediction on Friday night. We'll be flying Saturday morning before the data is available.

522. Prediction

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-07-27 15:36:23 UTC
From: John Knapp
Topic: 516 Message: 522

Good morning. I ran a fast prediction this morning, it looks like the balloon will land about 15 miles nw of Minidoka. The area is rolly desert with few roads and lots of sage brush (i.e. ticks). If your computer maps do not show many roads you may want to consider buying a county map which will show more detailed trails and dirt roads. You may need four wheel drive is some areas (there you go Paul - 4wheeling..).

Wish everyone a great time, wish I was going with you. See you later, will give John Stone a yell on the radio sunday afternoon (20 repeater).

523. Re: [tvnsp] Twin Falls Launch

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-07-29 05:00:42 UTC
From: Jeff Melanson
Topic: 497 Message: 523

Here is some preliminary info on the Twin Falls flight:

The Twin Falls launch was perfect. We filled inside a large building at the college, put everything together and had a launch to be proud of. Unfortunately the capsule stopped transmitting at 35,500 ft for unknown reasons. We tried to be at the predicted landing site but saw nothing. Eventually we went back to Lee's Ham Shack (K6ZVA) and ran more predictions with the most current data. We were not far enough NE to see the landing. We were able to define a narrow search area about 3 miles wide. We did try to have the Civil Air Patrol take a look but due to poor communications they didn't look were we needed them. Paul will see if it is possible to arrange a flight with them. Paul and John Stone have the landing site details and will probably post them shortly.
The August 11th flight is now in jeopardy. This flight will depend on whether or not Paul has enough time and equipment to put prepare two more capsules. Paul, is there anything we can do to help?

525. locator beacon

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-07-30 07:15:40 UTC
From: Rick Widmer
Topic: 525 Message: 525

Paul:

Here is a $40 kit that will send a callsign on a field programmable 2M frequency, starting after a variable time delay.

http://c118618-a.frmt1.sfba.home.com/fox.html

I have a feeling there is a still simpler design, but this is available, reasonably priced, small and light weight. It should make a good locator beacon. I do think it should have its own power supply, antenna, and be self contained. That way no failure of capsule control systems can cause a beacon failure.

It has the following items that can be programmed before use:
ID Message
Off time between transmissions
Hang time between transmissions
Speed of Morse ID
3 field selectable frequencies

You might also want to look at this:

http://www.tapr.org/tapr/html/Fpice.html

If the 'fox' transmitter is powerful enough to be recieved during an entire flight, it may be possible to take the transmitter from it and this circut, build them on one small board, replacing the radio and TNC in the capsule. You might be looking at an entire transmitter package about the size of your existing controller board, that replaces the weight of the transciever and TNC.

This kit handles X.25 packet encoding, and scaling data. GPS is a native format. It looks like you can even set it up to prescale data for transmission so battery voltage is sent like 6.25 instead sending the ADC output value. It requires PIC programming, but I have a friend who has been doing it for years.

526. GPS network glitch on Saturday

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-07-30 13:36:01 UTC
From: Craig Brunson
Topic: 526 Message: 526

I don't know if you know about a reported GPS network glitch that occurred on Saturday, but the TAPR group has at least 5 locations across North America that lost all GPS activity for a period of time. My boss was flying back from Ashland, Oregon at the time & his GPS navigation went dead. This was on Saturday afternoon & I think your launch was in the morning so this may not have effected your system. I am still looking for others that saw this.

On another note, we fly aircraft beacons on a 'practice' frequency, when we fly our high altitude balloons. This gives us a backup for locating the payload when it comes down. It is a small board about 2 x 3" with a pre-built antenna. Just add batteries (3 ea 2/3 A for 9v) and it is good for about a week. Our tracker aircraft has the DF antennas on the belly & will give a bearing to track.

The beacon is the board from a series 3000 ELT beacon. The mfr is Pointer, Inc. in Tempe, AZ. You can get contact information at: http://www.pointerinc.com/

They are a bit costly I think. Somewhere around $90. This could be used with the CAP aircraft, using a DF receiver, or with ground based receivers with a beam.

You could also make an HF QRP beacon a lot cheaper. My boss, K7IRK, has made these before.

531. Status, 30 July

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-07-30 19:11:48 UTC
From: Paul Verhage
Topic: 531 Message: 531

I've put the log together and imported it into a spread sheet. Here's the results.

The main battery voltage went from 6.03 volts to 6.25 volts over 50 minutes. This has never happened, the main voltage tends to drop slightly during a flight. The computer on the capsule did not reset itself, it functioned perfectly until it just quit. The servo voltage acted normally, so I'm confident the increase in the main voltage was real. Saturday night when I went to unload my car, I found the trunk filled with sulphur dioxide. One of the test batteries shorted out. It melted a plastic box, a nylon bag, and a spot in my trunk liner. The battery was from the same batch as the battery that went up on TV01E. It may be a coincidence, however.

By the way, S&G is running out of batteries and rasied their price to $35 (use to be $20).

There are three temperature sensors inside the capsule. Two of them measured normal temperature decreases, the third shows a lower than normal temperature.

The average ascent rate is closer to 650 fpm. We need to rerun predictions on this rate and create new estimates of the recovery zone. The software prediction will be modified based on the balloon's actual performance up to 35,500. John, since your closer, can I stop by tonight and run these predictions with you? I need to pick up the helium while I'm there.

Jeff has some ultralight pilots who are interested in doing the rescue. We need to generate a new solution soon, for them. Since we know the actual ascent rate and the landing site is not strongly effected by the altitude changing from 70,000 to 85,000 feet, I think we have a high proability of recoverying the capsule, once we begin an airborne search.

To launch the August launch, we need a tracker (TNC, GPS, and radio). If someone has a stand-alone setup they'd like to launch, please contact me (631-7162). We just need to track the camcorder, there will be no other data collected for this flight.

I have a TNC and HT at home, but no spare GPS. An ETREX GPS should work. I'll start a search for one. Bob and Leonard, where did you find your's? There's a greater chance of sucess if we could use someone else's tracker that has been tested, rather than trying to build a new one.

U of Montana, can I convince you to come out to Twin Falls and launch your capsule with my camcorder? Please call me at (208) 631-7162 if something can be worked out. I have a 3000 gram balloon and helium for the flight, I just need a lift.

I have a new design for a balloon controller. I'll shoot a copy tonight. After I try soldering it together, I'll send a copy to Bob and Leonard. I'll need an address from you.

There are 43 digital imagines waiting for us to download. If the other cameras worked properly, there are 16 pairs of visible and IR photos waiting there.

Paul

Can I get a copy of the raw data and a link to the info on how to decode
it? I'd like to try to write a program to decode it in the field.

Also, did I hear there was a way to get the data off the Internet in
near real time?

I'd like to take a look at your design too. I don't need a board, just
the schematic, layout and parts list.

A sample program or two would be nice.

Thanks, Rick

Hmmm..
I wondered why i had to restart my GPS Saturday after i got off work.
Went to work Saturday morning(7:30AM) til around (12:30) to finish up
an emergency project.
When i got in my pickup to leave work,the gps had a message to power
down and restart.
At home, I checked the progress of the launch to find only one received
report
from the Balloon. There was only one incomplete gps transmission at 35K
feet.
I believe that was the last altitude reported by the chase crew also.
Kind of a weird coincident now that i think about it after your report
Craig.
X-file story material here maybe?

Hi all,

Ron Bolander is the ultralight pilot I spoke with. He will ask his group if they want to fly this mission. He believes they would be excited about it because it would give them a fun objective. He needs at least one other group member to go with him for safety reasons. We would have to provide some ground support, I.E. carry some fuel to refill. These pilots can land almost anywhere. If there is a good road near the capsule they could possibly bring the capsules back. If not then they could get a GPS fix on it and we will have to do some 4 wheeling and hiking. They can't fly the mission this weekend because of a prior commitment. They can fly on the same day we plan the night launch. Ron would like to have a meeting next week to discuss the details. We would need to show them some capsules and a parachute and maybe some photographs of previous landing sites. We would need to show them how to disassemble the capsules if we choose to have them bring it back. They would have to split the payload up among them due to weight considerations. 17 lb's is significant on an ultralight. Ron would prefer to have the meeting on Monday or Tuesday night to give enough preparation time. Ron's group has a spare portable aircraft radio so that we can be in contact with them during the mission. If we can come up with a lightweight portable tracker then we could track his location and coordinate the search efforts. Does anyone have a suggestion or equipment available? I agree with Paul that we have a high probability of success. The more help we get with manpower and equipment the better our chances. I also think we should offer an extra incentive. For example, the one who finds the capsule first get's a free lunch or a free TVNSP t-shirt.
Ron used to be a Ham but has let his ticket run out past the grace period. Ron is interested in getting his license again. We also talked about possible future missions to help track and to get some aerial photography of the balloon. There are a lot of possibilities here.

Paul,

What was the last known position of the capsule, and what was the projected landing area? I have the next couple of days off, Tuesday and Wednesday...I wouldn't mind taking a drive over there to look for the capsule. And I promise to take pics and get an exact fix of the landing spot if I find it. Anybody else interested in going?

537. Capsule Recovery

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-08-01 02:13:48 UTC
From: Jeff Melanson
Topic: 537 Message: 537

Hi All,

I just got off the phone with Paul and he wanted me to bring everyone up to date on a few things.
We will have a meeting on Monday, Aug. 6th, with the ultralight pilots at Meridian Pizza at 6:30 P.M. Please plan on attending even if you can't do the rescue. The recovery mission is planned for Aug. 11th. We will show them what the capsules and parachute look like and coordinate Air and Ground crews. Paul will also be showing the video from the camcorder that fell back to Earth.
It looks like Paul will not be able to have a capsule ready for The Twin Falls flight. He is working on arrangements to go to Montana and fly the camcorder on their capsule. Paul will keep us up to date.
The T-shirts are on order.

Who can attend the meeting?

Who can go on the recovery mission?

Paul's phone number is 631-7162.

KD7INN
Jeff Melanson

Jeff, I will be at the meeting. Is the meeting at
Idaho Pizza in Meridian?

Hi John,

Yes, we chose Meridian this time. This is where the ultralight group
usually meets. It will be Monday at 6:30 P.M.
Can I convince you to come on the recovery mission?

542. RE: [tvnsp] GPS network glitch on Saturday

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-08-01 20:23:16 UTC
From: Paul Verhage
Topic: 526 Message: 542

If the GPS quits outputting data, it shouldn't effect the capsule. It's programmed to ignore the GPS if it doesn't recieve data within 30 seconds.

However, I'll need to review the log, we may have quit at the time it was looking at the GPS.

There is a possibility that if the GPS was putting out gibberish, the basic stamp would have waited until it straighten out.

Perhaps we do have a possbility here. What time did the GPS glitch occur and what would GPS recievers output?

Paul

The pizza meeting for the recovery is scheduled for 7:00 PM. location is the Meridan Idaho Pizza Company. Topic: Getting my baby back.

We'll need crews to drive out to the predicted landing site to help out with the air search. I'll proably be driving to Montana that afternoon, so I'll be able to help out for the morning.

I'm interested in driving out to the predicted landing site this weekend, for a brief ground search. The predicted landing site is over 20 miles west of American Falls. If you're interested, give me a call at 631-7162.

I need to look into this GPS glitch that occured on Saturday. It's possible that locked up the flight computer. Bob Moody, who has experience with these lithium batteries, says the voltage rise is normal. I'll update the webpage this week so everyone can see what data we have.

I am working Monday so can not make the meeting. I would appreciate a posting to the list of the salient points from the meeting. I would be happy to help with the recovery mission. Has there been any consideration to a ground search prior to the 11th with the latest landing projections? Please keep the list posted as to time and date.

Stephanie

Jeff

I can make the meeting Monday. Not sure about the 11th yet. Last time i commited,my work got in the way. This is our busy season at work,so i have to be careful about answering my phone. Should get caller ID i guess.

If i can make the llth search,would it be of any help if i brought my ATV 4-wheeler to help cover more ground? Have no idea what the terrain access is like.

Topic: 537 Message: 546

Hi Everyone,

There's been some more changes and every effort will be made to keep everybody up to date. At this stage of planning changes shouldn't be to much of a surprise.
The Montana group will not be available to launch Paul's camcorder, therefore we will go ahead with plans to launch our own capsule on the 11th at 10:00 P.M. as originally planned.
Someone e-mailed Paul and offered to loan a tracker to Paul for this flight. At the time Paul turned down the offer because he was planning to launch with Montana. Unfortunately Paul can't remember who made the offer. Would that person please call Paul right away to make arrangements for shipping the tracker to him? Paul will pay for shipping. Paul's cell phone number is 208-631-7162. This is greatly appreciated.

The recovery mission and the launch will take place on the same day. Yuk! What a long day. This has to happen because of two things. 1) The ultralight pilots are available on that day and 2) the Perseid meteors won't delay there arrival. This is a tough one to ask everyone to participate in both events. I have decided to go for it.
The ultralight pilots will probably fly from Nampa to Jerome on Friday afternoon. They will camp overnight at the airport and fly the mission in the morning. Anyone care to join them? I'm thinking that I will drive over early Saturday morning. Paul's not sure what he will do yet. I think I will reserve a room at Motel 6 again. After the search and recovery mission I will take an afternoon nap and be rested for the launch. After this launch and recovery I will return to the room and sleep some more then return home.(Hopefully that's two recovery's in one day!) Anybody have any better ideas? We can discuss these details at Monday's meeting. Anybody in Twin Falls have a basement to crash in?
So far Mike Garske, John Knapp, Randy Farley, Ray Silva, Paul Verhage, Ron Bolander and the other pilots, and myself will be at the meeting. Stephanie can't be at the meeting. We will let her know the highlights of the meeting. For Saturday's recovery mission we have Mike Garske, Stephanie, maybe Randy if he doesn't have to work, Paul, myself, and of course the pilots. If Randy can go he has an ATV 4-wheeler available. I have not heard from anyone else yet. Now that the launch is back on how many brave souls can do both on Saturday? How about Twin Falls folks? Can we generate some interest for both of these events?
Stephanie asked if a ground search might be planned prior to the 11th. Paul had some thoughts about going out this weekend. I can't make it. Would anyone else be interested including Twin Falls folks? If it was found prior to the 11th that would make launch day a little easier. If anyone is interested please call Paul at 208-631-7162. He is making maps

of the recovery area. The recovery is around Mosby Butte(pg. 29 of your Idaho Atlas). I don't think anyone should go alone or at least have your radio with you so you can call for help if needed.

548. Re: [tvnsp] Capsule Recovery

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-08-02 05:20:21 UTC
From: Jeff Melanson
Topic: 537 Message: 548

Hi Mike,

I see I made a misleading statement in my last email. When I asked if anyone would care to join them I meant to camp with them on Friday night. Unfortunately the ultralights all have one seat except for one. The pilot of that one is not yet signed off to carry a passenger. I am told that the pilot has plenty of hours and just needs to do the paperwork to carry a passenger. We can ask at the meeting if there are any others. It would be fun if there is. Most of the pilots have GPS. They have a spare handheld aircraft radio that we will use to communicate with them. Ron has expressed an interest in flying with us on future missions. I'm sure the others will also. I'll bet there will be opportunity to fly with them later on provided the proper paperwork gets done. Ron will be getting his Ham license again and he will also work on the other pilots to do the same. Someday we will be chasing the balloons from the air! That could be an unfair advantage if Paul buy's lunch for the guy who catches the space capsule!
I'm glad to hear you can help with the launch. Minimum launch crew is 5 crew members. We may be tired by the time were done but it will be a night to remember!
It would be neat if someone had a tracker for one of the ultralights for the mission. Once we introduce them to APRS I'll bet they'll get their ticket and equipment. What a great way for there ground crew to track them!

I'm interested in doing a ground search this weekend, if anyone else can go along.

On August 11 the Discovery Center would like a display on the balloon project. If a crewmember is not going to Twin that day, they could also give a presentation. Is anyone interested? If not, I'll set up something on Thursday or Friday morning.

If Zack can send a tracker, it will just be a programmed TNC. We'll still need a GPS and HT to attach to it. Does someone have an ETREX with comm cable?

Call if you think you can help out

631-7162

Stephanie and Randy,

I have ordered components to to make my own stand alone tracker. I ordered an eTrex GPS, a KPC-3 Plus, and an Alinco DJ-S11T. The stuff should arrive Monday and Tuesday. I am building the wiring harness this weekend. I plan to use this on future near space flights. If Paul needs it he might send it up on his balloon on the 11th. We might put it on one of the ultralights during the recovery mission. What I want to know is what should all the settings be for the KCP-3 Plus?

552. Predicted Landing Sites

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-08-03 05:28:22 UTC
From: K7JPS - John
Topic: 552 Message: 552

Based on the data from the NWS which launched their balloon about 20 minutes before ours, TV01E should have landed at N 43.0601 W 113.1673. However the last known location of the balloon was 4.62 miles at 89 deg. of the predicted location for the same altitude. If there were no other variations in the winds for the rest of the flight, that would put the landing site at N 43.0603 W 113.0745. This is in the Mosby Butte area of BLM Lands, 14 miles NW of Aberdeen, ID.

I will be at the Monday meeting in Meridian. If TV01F is a go I will come for that, but probably wont try to make the recovery efforts earlier in the day.

Jeff and I will begin work on the tracker capsule tonight. If you're interested in helping out, please give me a phone call. We want to get this capsule up and running in time for the August 11 flight.

On Sunday we will drive out to the predicted landing site and do a ground search. We could use more eyes. If you're interested in taking part of this adventure, please call me.

I'll set up a display at the Discovery Center next week, proably Friday.

Paul

Hi Stephanie,

Paul and I are going out on Sunday early (Aug 5th) to do a ground search. I had my brakes fixed so I'm ready to go. If anyone else can go please let us know. It would be nice to have two 4 wheel drive trucks just in case.

If you are going to use the tracker for normal land use,just follow the settings recommended by the nwaprs.org site.

I'm not sure what the "best" setting for a balloon would be as far as the un-proto path goes. I'm thinking WIDE,WIDE or WIDE2-2 would be plenty. Hopefully others with more "air time" experience will pipe in. You would obviously use Pauls settings he had in his last tnc along with a change in the un-proto path. We dont want it ping ponging too much or it will cause havoc with far away digi networks with transmissions every 10 seconds.
The last tnc never had a proto path set,so it did not utilize any of the digipeaters in the area to get out and "touch someone" while it was at low altitudes on ascent or descent. You could only pick up the balloon direct. We can discuss this further at the meeting.

Jeff,
My experience with trackers in the Women's Challenge cycle race and a recent hot-air balloon flight suggests that an unproto path of WIDE2-2 or maybe WIDE3-3 should work just dandy for getting into the digipeaters and ultimately an I-Gate where anyone can look it up on map.findu.com if they know what the callsign of the tracker is.

All of the digi's in this area use the widen-n protocol. Because many
would like to watch, why not use a wide6-6?
Also, the ltp Location Text Path should also be set to wide6-6.

Doug

I would help more but Aug 11 is my High School class reunion and my wedding
anniversary.

Hi Paul & Jeff,

Just to let you know that I intend to be in Twin on the 11th. I can't commit yet for the area search but I will commit to the pm launch and chase. I will try and be there for the search and will let you know if I can. I will not be able to go with you tomorrow as I have a client's needs to take care of tomorrow (last minute thing). I wish you both luck and hope that you disappoint the ultralight pilots ;-)

565. Ground Search

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-08-06 05:22:42 UTC
From: Jeff Melanson
Topic: 565 Message: 565

Hi All,

Paul and I have returned from the ground search but we did not find the capsule. The terrain is open and we found good viewing areas to search from with binoculars. We could see a long way but I'm sure the capsules we just over the next hill. There are scattered white rocks in the area that really stand out. Some of these are about the same size as the capsules. Since the capsules are white I believe they will stand out also. Let's see what the ultralight pilots can do. Don't forget the meeting at Idaho Pizza in Meridian at 7:00 PM Monday. See you there!

567. Predictions for TV01F

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-08-07 05:08:46 UTC
From: K7JPS - John
Topic: 567 Message: 567

Here is an early prediction for TV01F. TV01F is the night flight from Twin Falls on August 11 at 22:00 MDT (08/12/01 04:00 UTC)

Launch location: Expo Center - College of Southern Idaho, Twin Falls, ID.

Lat. 42.5830 deg
Long. -114.4678 deg
Altitude 3700'

Ascent Rate: 800 fpm
Descent Rate: 1200 fpm

Predicted Landing Site, data from BOI 8/7/01 00:00 UTC.

Lat. 43.1446 deg
Long. -114.4862 deg
Bearing 358.6 deg True
Range 38.8 mi.
Duration 159 min

This is approximately at the cross of Thorn Creek Reservoir Rd. and Preacher Creek Rd. in northwestern Lincoln County. This is 7.3 miles bearing 257 deg. from Shoshone Ice Caves.

I have not been able to view the MRFs so I'm not sure what the winds will be doing the end of the week.

John "I'm not climbing Davis mountain at night" Stone

568. Twin Falls Weekend Rundown

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-08-07 15:36:11 UTC
From: Mike Garske
Topic: 568 Message: 568

Everyone,

Here is the details from last nights meeting about the Search & Recovery of the TV01E capsule, and the night launch of TV01F.

1. We have 2, possibly 3 ultralight planes to help with the search for the capsule. We will be meeting them at the Aberdeen International Airport north of American Falls at 7am Saturday morning. From there we will provide support and chase them on the ground as they search for the capsule. We will provide the fuel for there aircraft--they mentioned they use Chevron premium for gas. They have only a possible 4 hour flight window before the heat of the day forces them to land for the day, this means that we need to be at Aberdeen airport waiting for them. For people with Air band capabilities on their amateur gear, the pilots will be on 122.775 MHz with Aberdeen airport on 122.900. We will have an HT capable of talking with them that they will provide to us for the search.

2. For the ground teams helping with the search, be sure to bring the proper supplies for the area. This includes: Water, munchies, sunscreen, sturdy hiking boots, hat, batteries for HT's and GPS gear. Binoculars would probably be a good addition too. Maps of the area are recommended also.The search area will include Blaine, Power, and Bingham Counties. Be ready for a hot day hiking in the desert, with one eye searching for the capsule, and the other watching for snakes. Lets be safe!

3. The current roster for the weekend includes the following people: Paul KD4STH Cell Phone # 631-7162
Jeff KD7INN
Randy N7GPS
Mike KC7DPD
John Knapp KD7HGS
John Stone K7JPS
Stephanie KC7DBA
Norma KC7DAZ

The repeater we will use for the recovery and night mission will be 147.000, NEGATIVE OFFSET, 100Hz tone. We will also be on simplex, 146.520 for the fringe areas and holes.

I don't recall exactly who is getting to Twin Falls on Friday night, but several people will stay at the Motel 6 in Twin, and Paul will be at the KOA nearby. The important thing is that we show up at Aberdeen at 7am Saturday.

4. The Launch of TV01F - The launch is at the Expo Center in Twin Falls Saturday night at 10pm, with launch preparations starting at 8pm (if this is wrong, please send a correction notice!). The launch point coordinates are: 42.58303 Latitude, -114.4678 Longitude, Altitude 3700'. There will be two separate APRS beacons on the launch vehicle, call signs KD4STH-11, and KD7INN-11 will be used with the WIDE 3-3 format. We should be on the website www.findu.com or www.aprs.net under those calls.
We will be filling the balloon in the Expo Building itself. On the flight we hope to capture pictures or video of the Perseid meteor shower! There will also be 2 strobe lights

on the launch vehicle for the visual tracking of the balloon. We also will have the new T-shirts for the group on board so they can take the ride up to 100,000+ feet! The balloon will go up and be at the maximum flight altitude by midnight, with a landing of around 1:30am. Hopefully there will be a recovery that night, but if the capsule lands in the lava fields, we will wait until morning to recover it.

SPECIAL NOTE FOR MARK CONNER - Please send this information out to all the other balloon groups "out there", so they can monitor the flight as well. Thanks!

5. Start running predictions for the winds aloft this week and post them to the list! Again, the launch point is: 42.58303 Latitude, -114.4678 Longitude, Altitude 3700'

If there is anything I may have missed with the this information ridden email, please correct it ASAP!

Thanks and see ya out there!!

Mike Garske KC7DPD

571. RE: [tvnsp] Predictions for TV01F

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-08-08 04:22:55 UTC
From: K7JPS - John
Topic: 567 Message: 571

Paul just stopped by and picked up the empty helium tanks from the last flight. He will get full tanks tomorrow and drop them off for me to transport. He said that Zack's tracker arrived with all of the parts so he will install it in a capsule and test it out. The T-shirts will be available on Thursday.

I finally got a look at the MRFs. Right now we are influenced by a high pressure system to our south east so the winds are not very strong. Looking at Saturday, there will be a ridge moving though the area late in the day, so the winds will be more from the west and picking up speed.

Here is today's prediction for TV01F.

Launch location: CSI- Twin Falls, ID.
Lat. 42.5830 deg
Long. -114.4678 deg
Altitude 3700'
Ascent Rate: 800 fpm
Descent Rate: 1200 fpm

Predicted Landing Site, data from BOI 8/8/01 00:00 UTC

Lat. 42.7714 deg
Long. -114.2818 deg
Bearing 35.9 deg True
Range 16.1 mi.
Duration 159 min

This would put us along the Milner-Gooding Canal in Northern Jerome County.

What do you have for a landing elevation? This is close to what I had for 08/08 0z data. One of the tricks is to run a prediction and then adjust the landing elevation and run a second prediction.

I have the two helium bottles. Each was tested and does have helium.

I filed the NOTAMS this morning. I also contacted Rick nat the planetarium, they're still expecting us.

We'll meet for dinner on Saturday, at 5:00 PM, at the Mongolian House. It's located on Blue Lakes, in the Fred Meyer's parking lot. After dinner I'll head to the planetarium. The Expo Center will be opened at 8:00 PM.

The KOA has kabins available for $33. They're located between I-84 and Twin, on exit 173.

Paul

574. 8/9 0z Predictions for TV01F

Paul just dropped off the helium this evening. He is planning a dry run of the capsules with Jeff Thursday evening.

Using the same launch data the predicted landing with the 08/09/01 00:00 UTC winds, the landing is at N 42.5709 W 113.8601 this is 91.4 deg at 30.9 miles about 3.5 miles west of exit 208 on I-84.

Is anybody else running predictions? I would be interested in any variations.

John, I ran the prediction this morning and got the
following:

Landing Site:
42.6048 lat, -114.0278 long
Flight Time 163 minutes
Bearing: 86.0 True
Range: 22.4 Miles.

My landing altitude was 1 feet so I know I may be a
little off.

The MRF doesn't show a lot of change in the winds in
the next 48 hours.

580. 8/10 0z Predictions

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-08-10 05:13:49 UTC
From: K7JPS - John
Topic: 580 Message: 580

John Knapp's and my predictions from this mornings winds are within a few thousandths of a degree and about 1/10th of a mile. Randy, can you share some more specifics because my range was 10 miles shorter then yours?

My prediction for this evening shows that the dominant winds are now out of the WNW. Lat 42.5056, long -113.9424, bearing 101.1 deg, range 27.3. This is SW of Burley which is a change from the last 36 hours when it was NW of Paul. The biggest challenge for recovering in this area would be to make sure we are on the right side of the Snake River.

This morning's prediciton gave me a landing site of:
42.4809 lat -113.9902 long
Flight time of 157 minutes
Bearing: 106 degrees True
Range: 25 miles.

I don't have map with me at work but I believe that is
south of the river and will land about half way
between Twin Falls and Burly.

I couldn't get to the MRF page so don't know if the
prediction for tomorrow has changed or not.

John Stone - what did you come up with?

See everyone tomorrow morning.

I don't get off till 2:30 today.
If my packing goes as planned, i hope to get on the road by
5:30 or 6:00 PM.

BTW, was 10 gal of premium fuel enough for the ultralights?
My notes say so,but just want to make sure. Had not heard if
a 3rd pilot was coming for sure. Hope fuel in Twin is
reasonable. Dont want to carry too much from my starting
point in Fruitland.

Not sure when we will be leaving. Probably around 6:00
or so. Will not stop at Twin Falls but continue to
Burley. I will stay on the 24 repeated as long as I
can, then switch to the 147.00 repeater. Will try to
contact some of you when I leave.

I will also try to monitor the aircraft once we get
headed out. When were they leaving?

Randy, we can fuel the gas cans in Burley at the
Chevron station there. It is next to the freeway and
on our way out. And it is usually cheaper than the
Boise area.

585. Ultralights cancelled!

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-08-10 19:11:31 UTC
From: Jeff Melanson
Topic: 585 Message: 585

Hi all,

I just received this information. The bad news is that the pilots do not feel comfortable with the weather conditions and the long flight to Aberdeen. Afternoon thunderstorms are predicted for the whole area and the higher temperatures degrade ultralight performance. As we all agree safety must come first.
We must get the word out to anyone who was planning to drive out tonight. I do not have everyone's phone number. Please help get the word out and post that information here so that we know who gets the message. I believe Mike Garske has the list of people planning to go on the recovery mission. Can you post those names?
The night launch is still a go. The weather that affects the ultralights does not affect us.

Jeff Melanson
KD7INN

From: Mike Garske
Topic: 585 Message: 586

Jeff,

Here are the names of everyone involved:

Jeff - KD7INN
Paul - KD4STH
Randy- N7GPS
John Knapp- KD7HGS
John Stone- K7JPS

My phone number is 846-9219.....I will be running errands until approx 5pm, but I will come back to check for emails or phone calls.

With the ultralights canceling, we are still needing to look for the capsule, I will still go over tonight so we can get an early start in searching for it. I will monitor 147.000 when I get there. I am staying at the Motel 6 in Twin.

Mike KC7DPD

Thanks for the update. Do we still want to meet
Saturday AM to look for the capsules? As a ground
search. I am game to do it.

No, I will be staying with my sister-in-law in
Heyburn. I was to meet Randy early in the morning.

I will be on 147.00 from Bliss eastward tonight and
tomorrow. Not sure when we will be leaving today.

590. Re: [tvnsp] Ultralights cancelled!

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-08-10 19:56:31 UTC
From: Jeff Melanson
Topic: 585 Message: 590

According to Mikes list of names, Randy, John Stone, and Paul are the only ones who don't know about the cancellation. Randy gets off work at 2:30. Hopefully he checks the email and lets us know he's got the message. I left a message on Paul's cell phone and waiting for his return call. Paul does not have access to email this weekend but might check it this afternoon. I do not know how to get a hold of John Stone but Paul does.
Let's see what Paul says about a ground search. The area is rough to drive into and that's makes it hard to cover a lot of ground. Maybe if we split up? Randy's ATV 4 Wheeler may do the trick. I suppose I'm game if you guys are. Paul and I were discussing how ineffective ground searches are but with this many interseted it may be worth going for it anyway. What are your thoughts?

Yes, I have reservations at Motel 6.

I am still on for looking for the capsule tomorrow, If we can find some high ground, maybe do some binocular searches. Spliting up will probably help.....

Ok, got get ready and get out the door if I am going to be on the road by 6pm....see you all in Twin!

Mike

Randy, lets continue with our plans to meet about
6:00am in Heyburn (Burley). Will try to contact you on
147.00 when I go by Twin. Unsure of the time.

It is much closer to Burley than Twin, but it is south of the river.
Here is a URL you might want to look at:

http://tiger.census.gov/cgi-bin/mapsurfer?infact=2&act=out&outfact=2&tlevel=-&tvar=-&tmeth=i&mlat=42.4809&mlon=-113.9902&msym=bigdot&mlabel=&murl=&lat=42.48090&lon=-113.99020&wid=0.360&ht=0.130&conf=mapnew.con&map.x=211&map.y=182

This is an area map with the balloon landing spot marked with a red dot.

Here is the url to the empty control panel for the mapping software:

http://tiger.census.gov/cgi-bin/mapbrowse-tbl/

There are bridges at Twin Falls, Murtaugh, Burley and American Falls.
The Murtaugh bridge is well hidden, but it should be on your maps.
There are several bridges in the Burley area, one is in town, one is
near exit 216 and the other near Acequia. The freeway crosses the river
near exit 216, so freeway exits give access to the North side between
Twin and 216, and South side access from then on.

Things are not so bad if the balloon lands closer than exit 216, but if
it is farther out you may have a very long drive to cross the river if
you make the wrong choice.

The Mongolian House is NOT in the Fred Meyer's parking lot. It is much further south, (3 mi from the bridge) almost to Addison avenue and the five points. It is the same place as the dinner before the last launch.

The place in the Fred Meyer parking lot is the Mandrin House. I believe the Mongolian House is a better choice as we can probably get the back room to ourselves again.

Rick

600. TVNSP launch TV01F

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-08-11 22:21:15 UTC
From: K7JPS - John
Topic: 600 Message: 600

Treasure Valley Near Space Program will be launching TV01F tonight (8/11) at 2200 MDT (8/12/01 0400 UTC) from the Expo Center at the College of Southern Idaho in Twin Falls. There will be two separate APRS beacons on the launch vehicle, call signs KD4STH-11, and KD7INN-11. You will be able to track them at www.findu.com/cgi-bin/find.cgi?kd4sth-11, www.findu.com/cgi-bin/find.cgi?kd7inn-11.

The fill will be indoors at the Expo Building itself. On the flight we hope to capture pictures or video of the Perseid meteor shower! We also will have the new T-shirts for the group on board so they can take the ride up to 105,000 feet!

The balloon is predicted to reach burst altitude at 0606 UTC, with a landing at 0640 UTC. Hopefully there will be a recovery at night north of Hazelton, ID. but if the capsule lands in the lava fields, we will wait until morning to recover it.

John Stone
K7JPS

601. TVNSP flight results?

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-08-13 03:33:18 UTC
From: Mark Conner
Topic: 601 Message: 601

This was all I got from FindU for either KD7INN-11 or KD4STH-11:

```
KD7INN-11>GPSPO:$GPGGA,063802,4239.9430,N,11411.6670,W,1,08,1.0,23843.4,M,-1
7.8,M,,*7E
KD7INN-11>GPSPO:$GPRMC,064402,A,4240.1298,N,11413.0333,W,11.3,257.9,120801,1
4.2,E,A*0F
KD7INN-11>GPSPO:$GPGGA,064802,4240.4298,N,11414.5062,W,1,08,1.1,25835.4,M,-1
7.9,M,,*7A
KD7INN-11>GPSPO:$GPRMC,064902,A,4240.5374,N,11414.8199,W,16.4,304.5,120801,1
4.3,E,A*02
```

This was during ascent and the last GGA is about 85,000 ft. The ascent rate during this period was 650 ft/min. Anything else?

KD7INN reported via APRS message that the TVNSP payload has been recovered.
Looks like the landing was about 15 miles NNW of Burley, ID. No more
details available - apparently lucky to get that msg through.

603. Altitude?

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-08-13 19:12:00 UTC
From: Rick Widmer
Topic: 603 Message: 603

Can someone tell me how you are getting altitude information for tracking. The aprs packet displayed on

http://www.findu.com/cgi-bin/find.cgi?kd7inn-11

appears to be the same data as a NMEA RMC message, and does not include altitude. That data comes from a 0183B message set, which does not include altitude in either of the messages it sends. Please tell me what mode to set the gps in, and where the altitude information appears in aprs.

Thanks,
Rick Widmer

604. Re: [tvnsp] Altitude?

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-08-13 23:02:00 UTC
From: Mark Conner
Topic: 603 Message: 604

The payload appeared to be alternating GGA and RMC sentences. Findu simply reports the last one received.

The following was found by using the 'rawposit.cgi' function on Findu:

```
KD7INN-11>GPSPO:$GPGGA,063802,4239.9430,N,11411.6670,W,1,08,1.0,23843.4,M,-1
7.8,M,,*7E
KD7INN-11>GPSPO:$GPRMC,064402,A,4240.1298,N,11413.0333,W,11.3,257.9,120801,1
4.2,E,A*0F
KD7INN-11>GPSPO:$GPGGA,064802,4240.4298,N,11414.5062,W,1,08,1.1,25835.4,M,-1
7.9,M,,*7A
KD7INN-11>GPSPO:$GPRMC,064902,A,4240.5374,N,11414.8199,W,16.4,304.5,120801,1
4.3,E,A*02
```

Controlling what sentences and when they're output from a GPS is usually model or brand-specific. Most GPS units output GGA and RMC (among others) once per second unless told differently.

I beacon the RMC message first, then the GGA second. This leaves the altitude on our D7s and D700 displays. Also any software that only shows the last string will show altitude. With a balloon, it seems that the altitude is the most important, after lat/long.

Alternatively, I have alternated the beacons, GGA every 30 sec, & RMC every minute. This alternates course/speed with altitude on our display every 30 seconds. (RMC first then GGA second in this one). This gives more altitude hits for our logs & less course & speed.

Gang,
Please find attached the text file of all posit report strings I received from the latest flight here at my home in Emmett. Notice that the unproto path makes a HUGE difference in coverage, because even at altitude, I saw nothing from KD6STH-11, and I certainly should have....

Ahh, okay...last I heard there were going to be two trackers on board...I stand corrected, thank you. If at all possible, I'd like to see ANY tracker that goes up to have at least a WIDE3-3 (and I would sugggest WIDE4-4, just to be sure) unproto path so that the three digis in our area can be put to use and all interested parties can follow the goings on, and because of your digi, we can get the interest of our neighbors to the south.
And if any are interested to know and missed it, I launched a tracker on a hot air balloon flight in Boise about three weeks ago (N7UBO-11...I believe this was a first in the area). I have the track data from that flight, too.... Maybe next time, I'll get to go with the tracker.

610. Flight Analysis

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-08-14 05:41:31 UTC
From: Jeff Melanson
Topic: 610 Message: 610

Hi all,

Much info will be coming in when Paul is finished processing the data. As some of you may have heard, from about 30,000 ft and down the tracker kept sending the same data. Upon recovery of the capsule I discovered that the Garmin Etrex GPS was turned off. I turned it on and the tracker updated to it's current position. The battery indicator in the GPS showed a nearly full charge. This GPS was run for almost 12 hours during a test prior to launch day. There were no problems noted. Fresh batteries were installed. I found some fine print in the manual that says "Alkaline batteries lose a significant amount of there capacity as temperature decreases. Use lithium batteries when operating the Etrex in below freezing conditions." Hmmmmm. Paul will make a graph of the temperature during flight.
KNSP - What kind of batteries did you use with the etrex?

Jeff Melanson

Everyone,

Good job recovering the capsule!! I had a great time at the launch and the chase, the balloon bug has bit me! I wish I would have been there for the recovery......the score so far....the desert 1, TVNSP 1....hope we find the other capsule soon!

612. TV01F report from Stephanie KC7DBA

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-08-14 18:19:26 UTC
From: Stephanie Steele
Topic: 612 Message: 612

Hi Group,

As most of you already know, TV01f was successfully launched on Saturday August 11th just before midnight (John has the exact launch time I believe). The launch went off a little late as we had to wait for winds to die down. The launch was flawless and we enjoyed watching the balloon with it's dual strobe lights as it drifted away. It was easily visible to at least 16k feet when I got busy and stopped watching it. Burst altitude was lower than the 105k feet that was expected (John or Paul have the exact burst altitude figures I believe). The balloon stopped transmitting APRS on descent at approximately 30k feet and the hunt was on. The chase crew, large and eager as they were, searched for the balloon all night and finally called it quits and returned to Twin Falls around 0700 hrs. Norma (KC7DAZ) and I grabbed a couple hours sleep at our motel before they booted us out. At 1130, as we were gassing up in preparation to head home, we heard discussion on the 147.000 repeater that the capsule was being heard by a station (Walter) in Paul, Idaho. We were soon joined by Jeff (KD7INN) and at around noon the search was on again. Jeff and I joined up and mercifully sent Norma to wherever it is in that part of the country that food and water exists so she could get some rest. Lee K7ZVA and Dean KI7CC joined forces and along with Walter (sorry I don't remember his call sign and our notes blew away in the thunderstorm that we got to enjoy later in the day) provided us with beam headings and triangulated intersections northwest of Kimama Butte to explore. Nary a peep was heard from the capsule by Jeff and I despite our best efforts in the search area. Reports continued to come in from Walter that the beacon from the capsule was stronger than the repeater to him. Late in the afternoon, as we were becoming pretty discouraged, we got fresh information that an unidentified ham on Kimama Butte was hearing the capsule on the south side of Kimama Butte, on his handheld. Dean generously went out and provided Lee with some fresh beam headings and Lee calculated a new position near Kimama Butte. As we began to climb the south side of the butte Jeff and I finally heard the music of KD4STH's CW beacon. Jeff and I began a foot search on the south side of the butte, (of course Jeff went the right way, down, and I climbed up the butte for some much needed exercise ;-) While on top of the butte I got to enjoy a thunder storm with lots of lightening. This was a welcome break to the heat but not too enjoyable as there was no where to hide from the electronics! Jeff mercifully retrieved me from the top of the butte and we headed down in the correct direction that he had determined. We also discovered that we had strategically made sure that we had no water with us during the day long search. That along with the extremely warm temperatures kept my sense of humor in a somewhat warped condition to say the least! The foot search continued to the SSW of Kimama Butte and at 2020 hrs the balloon was located approximately 2-2.5

miles SSW of Kimama Butte. The exact recovery site was N 42 44.033 / W 113 54.181. After photos and observations the somewhat wet but intact equipment was gathered up and we returned to Twin Falls to drink several gallons of water and have a huge meal to celebrate. Jeff and I committed that in the future no more of these searches will be done without the search crew having proper equipment with them. This would include, beam antenna and associated fox hunting equipment, dual APRS trackers on the balloon when at all possible, water, hiking boots, snake bite kit (oh did I forget to mention the rattlesnakes?), and about one each of every other item anyone can think of.

Sorry to all who missed the launch and chase, it was a very good time.

Here is the latest on our latest launch, Thursday, 9 August, from Tillamook.

Click on the following to see the press release again - with a pointer to
the photos they shot. There are some stills of our video on them also.

http://amesnews.arc.nasa.gov/

http://amesnews.arc.nasa.gov/releases/2001/01_58AR.html

http://amesnews.arc.nasa.gov/releases/2001/01images/marsplane/marsplane.html

Shannon-

if it was on the NASA channel, at ~9 this am, that's at 12 eastern, I think.
the same schedule for tomarrow says a video will be at 11:30, that makes it
8:30 here. it may be the same video

Hi All,

I have completed the failure analysis of the tracker and found the cause of the GPS shutdown. I placed the GPS in a zip lock bag and put it in the refrigerator. After one hour I checked and it was still running fine. I then moved it to the freezer for another hour. When I checked it the message "Battery Low" was on the display. The visual indicator showed the battery was drained but the GPS was still running. I placed the GPS back in room temperature. After a very short time I checked it again and it had shut down. I turned it back on and the battery indicator was back up at 50 percent. After another couple of hours the battery indicator was back to about 75 percent. Paul printed a graph of the temperature from the I-Button that was in the same capsule. During the decent the temperature had dropped to 5 degrees. This correlates to the approximate time the GPS shutdown.
What is the fix to this problem? Paul tells me that the temperature inside the capsules usually does not drop below freezing. However we decided that the equipment on this flight does not generate significant amounts of heat. The GPS manual says to use lithium batteries. I think I will look for rechargeable lithium batteries and also insulate the GPS a little more.

Hi Jeff,

Thanks for the report. I felt that this would be the answer to the mystery. This could also help explain the episode with the missing capsules.

I was giving this situation some thought last night at work now that I can think again! It would appear that during desent you would have a 30-35 mph wind chill factor to figure with the ambient temperature. Assuming that at 85k feet the temperature is 32 degrees, that would make the temperature 0-5 degrees with the wind chill. I would suggest using the lithium batteries and placing a chemical hand warmer pack into each capsule. They are lightweight and last for several hours. I would suspect this would eliminate the need for the equipment onboard to generate any heat. Just my $.02 worth!

617. Internal temps on near-space payloads

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-08-15 20:11:59 UTC
From: Conner, Mark
Topic: 617 Message: 617

It was interesting to hear that TVNSP had recorded near-zero Fahrenheit temperatures inside the capsules. NSTAR and NSBG have flown thermochrons and typically the lowest temperatures recorded on an interior surface were normally in the 40-50F range. On my NSTAR capsules, the NiMH batteries are well-insulated and typically get down to 50-55F at worst. Our results may be a little biased as we have typically flown at 900-1300 ft/min ascent rates. If we went up at 600 ft/min and spent more time in the cold air, we may have gotten near or below freezing even on our capsules.

I can provide Excel spreadsheets if anyone wants them, and one from the GPSL is available in the KNSP files area (see http://groups.yahoo.com/group/KNSP).

Making the capsule as wind-proof as possible may be the best way to keep the temperatures up. Many heat-generating packs will not work at high altitude because they require external oxygen. On the KNSP group I posted the results of an experiment flown on NSBG near the end of April where a heat pack was flown to 90,000 ft. I can't locate the exact message because the site is blocked here, but look for messages near the end of April or the first half of May.

Even though the heat pack won't work at high altitudes, it still might help. The pack would help keep the GPS warmer than it would be otherwise during the initial ascent, then it would take longer to cool off.

I use a Garmin GPS-35 for my payload, so I can expose the GPS unit to cooler temps than the batteries. If the ETrex can be powered externally, it may be better to do so and keep the batteries in a well-insulated internal container. Lithium cells are a useful but expensive alternative, as long as the voltages are compatible (normally 3V/cell instead of 1.5).

Normally we see temps as low as 30 degrees in the capsule. But this time it was much colder. It may have gotten colder because of the large opening around the camcorder lens.

I'll start looking around for rechargeable (and affordable?) lithium cells.

I'm making copies of the video and working on the flight data. I'll update the webpage shortly.

Cables in Nampa will embroider the t-shirts for $8.25. It includes a name, altitude, and flight designation. Other than that, your t-shirts are ready to pick up. Pay me if you haven't yet.

Paul

Stephanie, the wild chill factor you refer to is a measurement of how cold the air will feel on human skin for a given air temperature and wind speed. Paul can probably give you a better definition than I can. It is not actual temperature and would not be a factor in lowering the temperature in the capsule. But I do agree with you on the idea of a hand warmer to keep the batteries warm. Good idea. One other thought: this was a night launch and didn't have any sun on it to help warm up the interior of the capsule. Would that be a factor for the cold temperatures? Has anyone else done a night launch like this?

Stephanie, thanks for the story around finding the balloon. If you need another career try story writing. I really enjoyed the description of the trip.....

Thanks again

Hi John,

Thanks for the compliment. I really can sling a pretty good line of bs when I want to ;-)

I agree that "wind chill" in the normal sense is a description of "felt" cold on human skin. It also relates to how rapidly heat can be lost from any surface. Moving cold air cools faster than static cold air and therefore the reason for my using "wind chill" to describe the "enhanced cooling" of the capsule exteriors and therefore their interior. Of course we also did not have solar radiation to contribute whatever warming effect that it normally does (with the white nylon exteriors I suspect this effect is minimal but probably measurable). We also had less electronics onboard and of a type that were less likely to release heat into the capsule. I would still contend that heat loss from the capsule is accelerated by the movement of the cold upper atmosphere against the capsules. Likely not in the exact ratio as "wind chill" measurements but there is some effect. I would love to hear Paul's thoughts on this theory.

Watch out when trying to recharge lithiums. As far as I know, they are one shot batteries & NOT rechargeable. We just received a case of surplus 'D' cell packs. These have 10 D cells in each pack & we remove them for use in what ever configuration is needed. When we don't need as much power, we use 2/3 A cells. Also don't parallel lithiums to gain power. Their makeup will cause problems when paralleled.

We have used 2 D cells for 6v electronics, and added 2 2/3 A cells in series for 12v items. This kept weight down to a minimum.
Good luck

623. Re: [tvnsp] Temps and Other Stuff

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-08-16 02:41:44 UTC
From: Bill All, N3KKM
Topic: 617 Message: 623

Several observations from Near Space Balloon Group's flight data:
On out flight during GPSL2001 minimum inside capsule temperature during the ascent phase was 40 deg F at about 55,000 ft. On the descent phase the minimum inside temp reached 24 def F. Unfortunately our capsule lost telemetry, and the parachute, I might add, shortly after burst so I don't know at what altitude it reached 24 deg. These readings are consistent with other flights when we have recorded temperatures inside the capsule.

We came across some used laptop lithium-ion battery packs at a local computer show, and they contained some 3.8 volt ICR-18650 1250mah cells. Back in the early days of NSBG I successfully flew a 2 cell pack to power Paul's IHU board and Garmin GPS25 receiver. I stopped using them because I had no way of reliably recharging them. However, Maha's C777Plus battery charger will now specifically charge lithium-ion batteries. Additionally I was able to pick up a Sony FP-690 camcorder battery pack for about $100 and will be integrated into our new capsule now under construction. It's rated at 5400 mah.

It's been great reading your interesting posts.

624. Heater test results

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-08-16 03:08:18 UTC
From: Mark Conner
Topic: 624 Message: 624

See the message and linked GIF at:
http://groups.yahoo.com/group/KNSP/message/1178

Note that the heater packs get quite hot (55C/131F) at sea level. They are still somewhat effective at 75,000 ft, in that they were still warmer than the ambient air in the capsule.

The packs I used are typically used in boots and gloves. They are porous to air and contain vermiculite, salt, and iron powder. When shaken and exposed to air, they heat up and give off a bit of water vapor as a result of the reaction.

625. Other flight results?

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-08-16 05:16:25 UTC
From: Mike Garske
Topic: 625 Message: 625

Paul,

I didn't see the answer to the main reason we launched the balloon at night......did we get video of any meteors? Also, this is extremely far fetched, and we will never know the real answer, do you think the reason the balloon came down early could be a meteor strike? Just a wild thought......

The T-shirts...I would like to have my name on the t-shirt.

Mike KC7DPD

626. Re: [tvnsp] Other flight results?

Hi Mike and all,

No we did not get any meteor footage. When Paul and I tested the camera in our back yards we saw plenty of stars. We saw less stars on the flight. We believe it was because the camcorder was moving around to much. With our backyard tests we held the camera still. Meteors are moving very fast (8 to 26 miles per second) and we think the camcorder can't see them.
As I understand it most meteors are about the size of a grain of sand. They light up the sky at about 60 miles up. If we had made 100,000 feet we would have been about 20 miles up. What are the odds of a meteor surviving down to 85,000 ft and striking a small target? I suppose it could happen but it is more likely that the balloon had a defect in it. Even without meteors the video has some interesting footage. First there is the launch which shows Debbie crawling out of the building on her belly with a balloon. Then there is the crowd cheering and clapping as the capsule rose silently into the night sky. Next there is the sound of an airplane passing by in the distance(hopefully). Later you realize there is cloud cover when the stars begin to reveal themselves. We also get to see the moon rise. We see the city lights of Twin Falls and Burley off in the distance. Shall I go on? O.K. You can actually hear the balloon burst and the wild ride begins! On the way down we see a dark ghostly figure dance in front of the lens. The ghost is a large chunk of balloon hanging from the load line. But wait, where is the strobe light that's supposed to be attached to the balloon? As the capsules close in on the planet the strobe light begins to work. Ah-hah! The battery temperature dropped to much to operate the strobe! Thud! The capsule rolls and stops. The camcorder is facing upward but the sky is black. Cloud cover?

Topic: 617 Message: 627

Paul and all,

The camcorder was in the lower capsule all by itself. This capsule had a hole for the lens that was too large. The temperature sensor was in the upper capsule with the tracking equipment and seeds. There were T-shirts in both capsules.. The upper capsule had two small holes just large enough for BNC connectors to be passed inside the capsule from the antennas. The mylar was removed from the top cover to allow the GPS to pick up satellites. As Stephanie pointed out, the equipment does not generate much heat and we had no solar heating. I think it's safe to conclude that the combination of these things led to the problem. The rechargeables alkalines that Paul found will probably work well if we pay attention to insulation and holes.
The temperature graphs that Paul prints shows that the temperature drops significantly during descent. Then capsules are being stripped of heat as it falls through the atmosphere.

I discovered that the small black and white view finder on the camcorder has failed after this flight.

The video shows a few stars and the moon, but no meteors. Next
time we'll fly an image intensifer.

> Also, this is extremely far
> fetched, and we will never know the real answer, do you think the reason the
> balloon came down early could be a meteor strike? Just a wild thought......

Most likely not. Meteors typically don't make it down that far.

> The T-shirts...I would like to have my name on the t-shirt.

Since the marker does such an awful job of writing on the t-shirt,
I'm going to leave the personalizing up to each shirt owner. They
can be embroidered for $8.25 in Nampa.

I need to get t-shirts out to every one. Can we hold a meeting on
Saturday, the 25th? We'll review the video, discuss the flight, talk
about Dfing, plan the next flight, and show Jeff's capsule (a work in
progress).

Paul

One thing that may have made it worst is that the t-shirts took the place of styrofoam peanuts. I imagine the shirts don't provide the insulation that peanuts do.

Paul and the group,

Can we have a meeting on a Monday or Tuesday night? If not, I will settle on Saturday and try to play hookie from work for a couple hours.....I won't mind!

So what was the final altitude of the flight?

Also, we did see an airplane pass what appeared to be very close to the balloon, that explains the airplane sounds on the video.

This may be a solution for communicating between two payloads on the same flight without any wires.....

- Mark

Message: 17
Date: Thu, 16 Aug 2001 22:52:32 -0700
From: "Ken Gracey" <kgracey@...>
Subject: Parallax Announces 17 new BASIC Stamp RF Products!

==========
Parallax and RF Digital announce 17 new
RF products for the BASIC Stamp, including
a $21 keychain transmitter and $69 receiver!
==========

Dear Stampers,

Parallax (www.parallaxinc.com) and RF Digital (www.rfdigital.com) introduce 17 new BASIC Stamp-compatible 433 MHz RF transmitters, receivers and transceivers! Remote data logging, bi-directional communication and robot control is easy with these modules. Transmission range is between 30 and 250 feet depending on the choice of module.

See the RF Selection Guide:

http://www.parallaxinc.com/html_files/products/RF_Mods/RF_comparison.asp

See the really neat $21 keychain transmitter and $69 switch-mode receiver:

http://www.parallaxinc.com/html_files/products/RF_Mods/28004-28005.asp

The RF modules vary by package type, antenna style and software.

The package type includes SIP modules, keychain format, AppMods (plug into our Board of Education, BASIC Stamp Activity Board, BASIC Stamp Super Carrier Board) and carrier boards which hold any BS2-style module. The antenna selections include built-in loops, solid 2-inch antennas and wire. The RF modules allow communication in switch mode (i.e., pin goes high on transmitter -- high on receiver) and with asynchronous serial communication using the Stamp's SEROUT command.

Initial supplies are limited, but availability of all products is guaranteed for backorder. Parallax honors a 14-day no questions asked money back guarantee and 90-day warranty for everything we sell.

Sincerely,

Ken Gracey, Parallax, Inc.

642. Payload Engineering Information

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-08-19 00:13:24 UTC
From: mgray@ess-us.com
Topic: 642 Message: 642

For those interested in the engineering details on the payload and camera control packages flown on ANSR-1 and ANSR-2 (Arizona Near Space Research), I've included a link to my web site. The web site includes details about the packaging, hardware design, schematics, source code, and lessons learned. The payload computer utilizes a Microcontroller with 256K of flash memory and 512K of SRAM, integrated TNC, 16-bit ADC for analog telemetry, GPS receiver, and Bluetooth for a wireless network.

Jeff,

Do you want me to bring my quad antenna or my fox hunting antenna's? I don't use the quad for fox hunting as it has too much capture area. Or, I'll just bring them all for show and tell as you wish. I'll also bring my attenuator and other equipment if you want just say the word.

Stephanie

For those who were asking at the meeting tonight, and those who weren't, here are the url's for the arrow antenna and attenuator I brought for show and tell. They apparantly do not make the 'walking stick' antenna any longer but have instead gone for a break down back packer style which should work just as well. It is available in both three and four element styles.

On Sunday, John and I will make a search for the lost capsule by air. We'll have a GPS to lock in its position, if we see it. Then next week we can drive out to the capsule.

If you wish, you can send me the position if you find it, and I will try to recover it Monday. I don't mind a little 4-wheeling, and this would be for a good cause. If I get it you could pick it up in Twin Falls/Kimberly or maybe I can run it up there. I may have to go as far as Mountain Home early next week anyway.

I'll be surprised if you are not heard very well. With Cinnabar and Harrison I suspect you'll be heard well. I think transmitting your ground track will be valuable to analyize if any areas happen to be missed or if a second search is needed. Good luck!

659. New Controller and Camera

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-08-27 23:30:31 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 659 Message: 659

I've interfaced a MIM module to a Basic Stamp. Now the Basic Stamp can send telemetry over the MIM (the MIM is a one way TNC). That's the heart of my newly designed balloon controller. I need to test one more modification and then I'll be ready to send a blank board to Bob and Leonard. To the new board (CC/PS) you'll interface an Etrex GPS and radio. You need to add the following item to the board, itself,

Serial Servo Controller (SSCII, by seetron.com)
MIM Module (aprs.com?)
ULN2803
LM2940T-5
MAX-186 (maxim-ic.com)
BS-2P (parallaxinc.com)

The MIM is programmed once. The BS-2P is programmed before each flight. With the board you'll be able to digitize 8 different voltages, report on capsule status, operate 8 servos, operate 8 high power devices, report on 8 switch settings, and still have 8 expansion ports for operating cameras, etc.

Speaking of cameras, Bill, I'm getting ready to modify the Cannon ELPH. I opened up the camera and found the four solder points for the switch. After testing the front two appear to be for operating the shutter, but if I short them out, nothing happens. What do I have to do with the two back solder points?

Thanks,
Paul

Hi Paul and John,

I have had the privilege of listening to Steve Strom's (pilot) description of your adventure. He told me about landing at the Bear trap airstrip to change two fouled plugs and about the difficult takeoff. A short rough dirt strip on a hot day with two passengers. He said he felt the air search was an effective way to look for the balloon even though you didn't find it and that he learned a lot about air searches. He also said that Paul was looking a little air sick. I guess it was a little turbulent. Do you think you would have seen the balloon if it was there?

I was wondering what the result of the search.
Apparently there were some issues with the plane and
you were not able to find the ballon.

Is this correct? I really would like to know what
happened.

One of the back solder points is ground. I think it was the one closest to the end of the camera. One of the two front points operates the focusing mechanism and the other actually trips the shutter. I tied the two wires coming from the front of the switch together and took them to one contact of a relay. The ground wire went to the other contact of the relay. The relay operates and shorts the 2 front points to ground. The camera goes through the focusing procedure then trips the shutter with one operation of the relay.
Does that help?
Bill

John, can you print out a map of our flight path? I'd like to see if we missed something.

The search seemed to go well, until after we left Bear Cave. At that point the turbulence picked up. I'm beginning to wonder if we have mispredicted the balloon's landing site.

Paul

John Stone, can you email to the group the winds aloft report for the morning of the flight? Also, can you include the predicted landing points and the flight we took?

I can't update the webpages yet because of the campus firewall. Tomorrow I'll meet with IT and try to striaghten that out.

I'm including with this message the flight log.

Paul

> Can you send me a copy that has one record per line?

I'll edit the records and resend them.

> What balloon type? What was total payload weight? What was your predicted
> burst altitude?

The balloon was a 1200 gram Kaymont. weight was about 14
pounds with 'chute. I'm predicting an 80,000 foot flight.

My new balloon controller (CC/PS) is ready to be tested. John,
can I arrange a time to meet with you? I'd like to power it up near
your Kenwood and see how it intreprets the data. There's an * in
the APRS data that I won't be able to get rid of.

For the next flight, we'll use Jeff's tracker. I'll add my CC/PS so we
can operate a camera and the dropper. It will also send telemetry,
but not GPS data at this time.

I modified a Cannon ELPH as Bill All suggested for computer
control. I'll get it set up for the next flight. I still have to start on
the Teddy Bear.

Paul

The MIM module I'm using prefixes all data with an *. It assumes
what it is sending is a nmea sentence. The problem occurs
because I'm tricking the MIM into sending all data it recieves.

I can add spaces before my text, so what gets sent is,

* /123456z/4412.34N.....etc

If APRS will ignore a lone *, then this should be fine.

I plan to show the CC/PS at the summer conference. I have yet to
recieve confirmation that I'll be speaking, however. I asked in email
an hour ago.

Paul

My apologies for the 223K jpeg file but I thought that it would be of interest. It is a close-up of the aerial search that Paul and I conducted on 8/26 with Pilot Steve Strom. The triangles are the predicted landing sites based on varying burst altitudes. The area is from Bear Trap landing strip to Mosby Butte.

For those that did not hear how the search went. We left Nampa at about 7:30 Sunday morning. It took about 1:30 for us to reach Bear Trap from there we began searching the area at 500' - 700' above the terrain. We were able to pick out antelope, 8 x 12 corrugated tin shelters, and individual sage brush bushes on the ground. I even saw one National Park service yellow and brown sign, though I could not read it. We are sure that if we had flown over the balloon we would have seen it. On our fourth pass over the area, the plane developed engine problems and it was determined that we should make a cautionary landing a Bear Trap. After allowing the engine to cool, Steve pulled a couple of spark plugs. The gap on the first one he pulled had been bridged so there was no spark. Fortunately he had some new spark plugs with him, so after changing them out and doing a run-up to make sure the engine was performing well again we took off. We made two more passes over the area before the turbulence got to be to much for Paul and the fuel was getting too low for Steve so we headed home.

I have uploaded 4 files to the files section of our group area. They are the Boise winds at launch time, and a modified file that uses the wind data collected from the balloon until we lost contact at 35,275'. The third file is a Lat/Long file of our predicted landing sites that can be imported to Street Atlas after the descriptions have been deleted. The last file is a Street Atlas file of the track we flew on our search.

During my last contact with Dave Dobbins, he advised that you were definitely on the menu. The entire summer gathering format will likely be a little different this year with less seminar time and more show & tell and tech table time. I understood that they are anxious to have you do a presentation.

The APRS format spec is at
ftp://ftp.tapr.org/aprssig/aprsspec/spec/aprs101m/APRS101m.pdf

A separate e-mail from Paul corrected the * to a $. If the first
character is a $, APRS expects a GPS string. Even if the Kenwood
decodes it correctly, other APRS programs may not as it's not in the
spec. For post-analysis of experiment data having unusual formats is
OK, but I would encourage strict following of the spec for position
reports so that the locations are displayed correctly on all APRS
programs.

Also, if time is in hours/minutes/seconds, the character afterwards
should be 'h' (e.g., a time of 12 hrs 34 mins 56 secs UTC would be
123456h in the APRS output).

The MIM assumes a NMEA sentence, hence it prefixes with a $. I
can add blanks spaces after the $ and then the data I want to
send, or recreate a NMEA sentence. However, the NMEA
sentence will take more memory. Also I need to send data, which
begins with a >. I've got to figure out a way to get away with a $.

The APRS standard shows lats and longs of the format,
12334.4523N, do you know if APRS will accept 1234.45N instead?
I'm hoping to get by with a byte for the after decimal lat and long,
rather than a word.

> Also, if time is in hours/minutes/seconds, the character afterwards
> should be 'h' (e.g., a time of 12 hrs 34 mins 56 secs UTC would be
> 123456h in the APRS output).

That was my mistake, I saw it both ways, but wrote the wrong one
down.

Paul

I think if you're stuck with $, you're also stuck with NMEA. APRSPlus will support the Simple Text Format (a Garmin proprietary string), which is shorter. But I don't think any of the other programs do. You might not have to include the useless elements of the GGA and RMC strings - just put spaces or commas to fill them out.

If you send data to the MIM with a $ in front, but have arbitrary stuff afterwards, the APRS programs should just throw it away rather than try to interpret it.

To my knowledge, none of the programs do any parity checking of incoming NMEA strings.

I believe the spec says programs should use comma delimiting for parsing GGA/RMC sentences instead of position. Some GPS units put out only 3 digits of precision, I think. So you should be OK with 2 digits in the fractional portion, but it's worth testing with the D7 and any APRS programs you use.

Why is Ralph's prediction different than the one's we have been looking at? Did we miss something?

Yes, we'll meet this weekend. The rip stop nylon came in and we need to start sewing. This is a 3 day weekend, are you able to put some time into capsule construction? Did the i-buttons come in yet?

He used different ascent rates. I'll bring his notes with me.

No ibuttons yet, but there was an attempted delivery yesterday.
They should leave the package with a neighbor today.

From: verhap@occ1.sd01.k12.id.us
Topic: 682 Message: 682

I ran some tests with John Stone last night with my new CC/PS. It will transmit GPS sentences instead of forming posits. That requires just over half the memory of the the to do. I'll try sending telemetry as text data after a blank GPS sentence and see what happens. Other than that, I think the design is ready to go.

Paul

683. NSTAR Flight 01-E recap

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-09-01 21:33:39 UTC
From: Mark Conner
Topic: 683 Message: 683

It all seems so simple. Launch a balloon, follow the GPS data, pick it up between 90 and 180 minutes later. What could go wrong?

The launch team arrived at the high school between 7:20 and 7:45. We were running a little behind, but no big deal. We began filling the 350g balloon and stopped a little early to get a free lift check. However, the duct tape I used was not quite up to the job and the balloon pulled off the filler tube and floated away.

No real problem yet. We had a 2nd 350g balloon, and there seemed to be enough helium left to fill it. Maybe a little short, but if I had to I'd delete the camera/simplex repeater payload and save 5 lbs. We do a more thorough job of taping the neck to the tube and start again. When we emptied the helium, we tied off the neck and got a free lift estimate (wind wasn't too bad). The balloon had 14 lbs of lift and we needed to fly 11 lbs today, so we were in good shape.

Fired up the payloads, checked the data, and everything was running fine. We released about 0838 CDT (1338 UTC) and away we go. However, the camera didn't fire off the six low-altitude shots it was supposed to. Nuts. We waited until 10,000 ft and no pictures there either. Nuts again. We pack up and start the chase, heading east of Treynor.

We stop in Griswold to wait for the burst. Simplex repeater is working well, data is good, batteries are holding up. Still no indication of 35mm pix taken, but oh well. I didn't have time to debug that much anyway. We could see the balloon in amongst some wisps of cirrus. Burst occurs at 54,380 ft about as expected. Initial descent rates are good, simplex repeater isn't fluttering too badly, so looks like a fine descent.

Now the transmitter is firing off position packets every 5 seconds. It's stuck in the terminal-descent loop, which was to take pictures and positions that often until landing. Well, at least I'm getting pictures now. My concern for the batteries comes back, as now it is transmitting about 6 times more often than it should. A few minutes later I check the telemetry and the batteries are holding up - certainly well enough to sustain it until touchdown.

We head south on US71, then east across some gravel roads. Larry N0BKB is chasing from the east and north and appears to be in position for the landing. We estimated we'd be a mile or two away at the time.

The descent below 10,000 ft is about as expected - slow ground speeds, a loop back to the north. The payload exits the terminal-descent loop and goes back to 30-sec intervals - shoot, now we can use the extra posits. As it gets below 5000 ft, it appears the landing will be near a road which was convenient. We approach the landing site from the east.

As I crest the hill, I can see the parachute. It's almost hovering and appears to be off the ground a ways. At first I thought it was catching a gust of wind on the ground, but then I see it's hung up in power lines. I blurt out on our simplex frequency "oh, ****, it's in the wires". As we get closer I see a puff of smoke coming from one of the payloads. We're now up to about 1015 CDT.

We stop near the payloads and get out, taking some care not to park or stand too close. The smoking payload is now a burning payload and a few seconds later falls free into the grass at the side of the road, starting a grass fire. Two of the vehicles in the chase have fire extinguishers and the fire is put out. This was the telemetry payload.

Meanwhile, the second payload with the video camera and simplex repeater is still caught in the wires. There are five wires on this set, three 40-kV lines and two 6.5-kV lines (we learned all this later). The second payload is hanging on the topmost 40-kV line and the parachute is dangling from the load line coming from the balloon neck, which is hung up on another 40-kV line. It appears the J-pole antenna and coax was just long enough to touch two 40-kV lines with obvious effects. The second payload appears undamaged - the simplex repeater is working fine.

Of all the luck. Half a bazillion acres of open fields in Iowa and I snag a power line. Not only that, but it's of just the right size for me to short out. ****ing A, bubba. We are about 200 yards from a farm house - she came outside to see the commotion. Since we're out of cell phone range, we're unable to get a reliable call in to the power company, so I walk over to ask to use her phone. She says heard a bang and the power glitched for a few seconds. She thought it was a raccoon with good climbing skills but poor knowlege of power lines (again).

She graciously lets us use her phone. We call one utility company, but it doesn't service that area. The operator forwards the information to the proper one. We go back out and wait for the truck to arrive.

The truck arrives about 1145. Since it wasn't an emergency, they weren't in too big of a hurry on a Saturday, and later they said they didn't know we were waiting on them. The truck responding owns the 6.5kV lines but not the 40kV and he's not going to work their lines without their permission. So he radios the proper company and they have a truck not far away that's doing some tree trimming.

About 1230 or so the bigger truck arrives. They shut down the section of line and retrieve the package and cut loose the parachute for us. We exchange names and addresses and head our separate ways.

The telemetry package is a total write-off. Most everything is burned beyond recognition. The battery may still work, and the KPC-3 is not particularly melted. I may try powering it on just for giggles. The GPS-35 isn't identifiable as such - it's a lump of roughly the correct shape and volume. The 35mm is unusable, but the film inside might just be OK. Still haven't opened it.

The camcorder and simplex repeater, on the other hand and other payload, are fine. Since we had plenty of time to speculate, we figured the camcorder had enough tape to record it's interaction with the power lines. At a minimum, that would be really really unique - I bet Paul doesn't even have a tape like this. But, of course, as a final twist of the knife from Murphy, the batteries appear to have run down about 15 minutes beforehand. What I saw in the viewfinder looked decent, though, but I really wanted to see the power lines rushing up and the smoke coming from the other package. If I'm going to burn a $500 payload, I want some video.

The VX-1R running the simplex repeater is the same one that impacted with the previous video camera on Flight 01-B. It has now survived a 13-mile fall and tangling with high-voltage lines. I do not wish it any other unique incidents.

So, there you have it. Once again, NSTAR has managed to tick off a small number of Iowegians, first with gravity bombs and now by targeting the power grid. I hope they don't have any reactors in Iowa, as that's probably next.

Pictures later. Beer now.

Nope, ya got me beat again.

Sorry to heard about the landing and its result. I'll be interested in
seeing the video, however.

We did have one capsule land in a power line back in 1997. That
one managed to avoid shorting itself out and was retrieved safely.

How's your controller baord? Interested in testing one that uses a
MIM?

I was going to ask about a controller board. I'm not sure I want a MIM however as the AX.25 device. Seems too limited to have to start with a $ all the time. I have a TinyTrak II and it may be suitable, but haven't built it yet.

The CC/PS (nee IHU) is toast, literally. I think I can identify the BS2SX remains. Not flight-worthy, certainly.

I'm playing the tape now - still on ascent. Looks much better and more stable so far. No fogging through about 30,000 ft. I had short two-point attachments between capsules and to the spreader ring - not near as much twisting. So I learned one useful thing from today's flight.

- Mark

686. Videotape review

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-09-01 23:14:58 UTC
From: Mark Conner
Topic: 686 Message: 686

Just watched the entire tape. The payload was very stable both on ascent and on descent - none of the twisting and violent swinging observed previously. It seems coupling the payloads closely together and close to the spreader ring with multiple tie points is the solution. It was almost worth the loss of the telemetry capsule to see this work.

The batteries dropped out at 18,000 ft about 18 minutes before touchdown. Bummer.

The 35mm camera film appeared to be mostly used, if not completely. Unfortunately, it did not rewind into the container before tangling with the power lines. The interior of the camera had a lot of soot, but the film had not melted and the back of the camera should have remained light-proof. I'm hoping it's OK enough to get some pictures - according to the data, they'll all be between 54,000 and 46,000 ft.

Hi Mike,

September 29th seems to be a good weekend for everyone including Stephanie. Capsule construction is in progress. Paul will be over this weekend so that we can make significant progress. Tonight I will set up the sewing machine so we can start on the capsule exterior.

Mark Conner,
What was the length between your capsules and the spreader ring? How many tie points did you use? I assume four points as we do on our box capsules.

I used two (the handles on the coolers) and there was about 6 inches between the ring and the top capsule, then about 3-4" between the top and bottom ones.

If you're interested in rolling your own, the Project: Traveler board has been performing very well in its first two flights. Parts for the controller and the "TNC" run you about $50, and you can plug any kind of daughterboard into the motherboard to control servos, cameras, data aquisition, etc...

We've also got it a lot smaller from when you saw it... It's down to something like 4.5" x 3". We could supply you with PCB and the MX614 (which is hard to find). Everything else is available from Digikey. You'd need a C compilier (CSCC or whatever it is) and a programer for a 16F873 which I think I saw a homebrew one in Nuts and Volts last month.

Okay, so this means TVNSP has another shot at recording video
through the entire flight. We're planning a launch the last weekend
of September, using the 300 gram balloon you sent us. Were you
flying one of Ralph's balloons on this flight?

If there's arcing inside the camera, the light could have exposed the
film. I'll be curious to see what you get. Keep us informed.

Hi Zack,

What I'm really looking for is a simplified TNC in a small package that can handle the AX.25 formatting and conversion to audio. I like the BS2 chips for controllers, esp. the new functionality of the BS-2P. But I don't really need to fly a whole TNC most of the time - I used the KPC-3 mostly because I had one already.

I've read a little bit about formatting data for KISS-compatible TNCs, and I think that's easily doable from a BS2. The KISS TNC in QST about a year or two ago is sort of what I'm looking for, but I heard some negative things about that design. Maybe now that I'm starting from ground zero I'll look at all of that again.

The MIMs are close, but they require a $ to start the data. That screws up the APRS posit format for me, because I like to have lat/lon/course/speed/alt all in one transmission. The TinyTrak II might also work, but I need to see how configurable it is.

If you have some ideas on a small lightweight TNC let me know.

- Mark

I used two of Ralph's 350's, one departing prematurely. Mike W5VSI from EOSS told me they use hose clamps to secure their balloon to the filler, which is a really good idea to me.

The duct tape I used Saturday was some 4 rolls for $8 stuff I got at Sam's Club. The best duct tape I've seen is some 3M tape I got that was $4/roll at Menards. But I think I left that roll in Manhattan back in June and saw the Sam's Club stuff while I was shopping and just picked it up. Now I have 3.75 rolls of tape I won't be using.

> film. I'll be curious to see what you get. Keep us informed.

I got the photos back from Wal-Mart last night. The telemetry accurately reported that pictures were taken every few seconds starting shortly after descent. The film was mostly OK, but a portion of the last frame and the negative after that showed light contamination, probably from arcing (not a "lightning" or static discharge pattern, though). The rest had no problems other than the film advance caused about 5 pictures to be taken over 3 frames' worth of film. The take-up portion of the camera is mostly plastic, but the film cassette itself and that side of the camera had more metal which may have led to the arcing. There was a lot of soot on the cassette itself.

I attached a picture of the remnants. On the left is the KPC-3. The plastic front panel is burned off. The metalized DB25 shell did better than expected. The lump at the bottom center is the GPS-35. The mess on the right is the controller box. The white or light gray you're seeing is the chemical from the fire extinguisher. I'll have more photos up later on.

I've worked out a way to send data with the MIMs. You need to
send an empty GPS sentence first (like $GPGLL,,,,,,,,), followed
by a CR, then your data. The result is this...

$GPGGL,,,,,,,
>text data

or

$GPGLL,,,,,,
/posit info

Next I'll experiment with a PIC-E. Can someone download the PIC-
E documentation from www.tapr.org? Everytime I do, I get a blank
document.

Thanks,
Paul

That's slick - it may just work for what I need. Have you hit a memory limit for the number of characters you can send to the MIM? My posit strings can get close to 80 characters if I have a bunch of stuff in them.

I developed the circuit board for a cutdown device. Last night I tested it with the pager and it worked well. I have a few of the boards remaining. I'll bring a board to the VOI meeting this Wednesday for Doug. I'll drop off a second one to Jeff for his capsule. This winter, when we're working on capsules, I shoot some copies of the board.

We need to think about another meeting soon. We have a launch scheduled for the last weekend of September.

We have a new prediction for the July flight. John Knapp, did you generate a prediction? Is anyone interested in doing a SAR for the capsule?

Paul

There was no attached file with this email, however.....

On the GGA sentence, after the lat and long is other stuff,
including the altitude. The number before the first M is the altitude
in meters. The following number is a correction for the non-
spherical shape of the Earth.

Subject: My prediction and rationale
Date sent: Thu, 30 Aug 2001 10:22:52 -0500

Here is a set of touchdown solutions for you to consider and the rationale behind them.

A data set of 51 $GPGGA records was extracted from the telemetry file (TV01Egga.txt attached). This data set was imported to EXCEL to calculate derivatives and produce charts (TV01Egga.xls attached).

The first EXCEL chart plots GPS TIME v GPS ALTITUDE and finds the ascent rate knee (TV01Eta.gif attached). Below and before this knee ascent rate was 939ft/min (launch coordinates v knee coordinates below). Above and after this knee ascent rate was 551ft/min (knee coordinates v last coordinates below). It is my experienced assumption that this slower post-knee ascent rate was stable up to burst.

Based on this analysis we have the following set of known coordinates:

Launch coordinates (GPS):
42d34.9748mN (42.5829dN)
114d28.0628mW (114.4677dW)
1,127.3m (3,700ft)
12:21:26z

Coordinates at ascent rate knee (GPS):
42d41.8325mN (42.6972dN)
114d12.1824mW (114.2030dW)
8,205.0m (26,921ft)
12:46:09z

Last set of $GPGGA coordinates:
42d46.6520mN (42.7775dN)
113d56.7422mW (113.9457dW)
10,840.1m (35,566ft)
13:01:50z

Next we consider the best set of predictive winds aloft observations available, the 12z 28Jul01 BOI RAOB (BOI28Jul.txt attached). EXCEL is used to derive WIND SPEED and WIND DIRECTION and these values are plotted v altitude in two EXCEL charts. Chart TV01Esa.gif (attached) shows actual

wind speed (calculated from TV01E lateral movement) and wind speeds reported by the RAOB mission. Chart TV01Eda.gif (attached) shows actual wind direction and wind directions reported by the RAOB mission. There appear to be significant variations in wind speed and direction reports at lower levels but rough agreement at higher levels. Based on these comparisons I have decided to substitute TV01E observations for RAOB observations as far up as possible and then use RAOB observations on up to burst.

When TV01E winds aloft and BOI RAOB observations are combined we have a new data set that can be used by WBALTRAK (BOI_01_07_28_1200Z.dat attached and http://www.eoss.org/wbaltrak/index.html). WBALTRAK can then be set up for initial ascent rate (939ft/min), characterized descent rate (1000ft/min) and launch coordinates and altitude (we don't yet care about burst altitude). We then compare actual coordinates at the knee (26,921ft), 42d41.8325mN (42.6972dN) 114d12.1824mW (114.2030dW) (from above) with WBALTRAK predictions, 42.6952N 114.21W, and find them to be very close so we are ok so far.

Now we need to change our ascent rate to 551ft/min up to burst but WBALTRAK does not allow for this (I will be talking to Rick and making my case for a program change). The fix is to change launch coordinates and altitude to the knee and use the slower ascent rate from there. We can now compare our last set of TV01E coordinates at 35,566ft (42.7775dN 113.9457dW) with WBALTRAK predictions (42.7704dN 113.9571dW). Again variance is very small so we continue to be ok.

>From now on we wander into the unknown. We have no choice but to use the BOI RAOB for all higher level winds. We will assume ascent rate will now be constant up to burst. We need to vary burst altitude between some minimum and maximum values so I ran BALLIFT9 with 14 pounds, a TA1200 and 940ft/min and get a predicted 91,000ft burst. My experience is that this is the maximum and will use 80,000ft for the minimum and 85,000ft as an intermediate value.

Based on this analysis method I get the following burst and touchdown coordinates:

BURST @ 80,000ft ASL
42.9772dN (42d58.632mN)
113.2738dN (113d16.428mW)
TOUCHDOWN @ 2831ft ASL
43.1188dN (43d07.128mN)
112.8652dW (112d51.912mW)

BURST @ 85,000ft ASL
42.9802dN (42d58.812mN)
113.3149dW (113d18.894mW)
TOUCHDOWN @ 2831ft ASL
43.1222dN (43d07.332mN)
112.9103dW (112d54.618mW)

BURST @ 91,000ft ASL
42.9817dN (42d58.902mN)
113.3817dW (113d22.902mW)
TOUCHDOWN @ 2831ft ASL
43.124dN (43d07.44mN)
112.9825dW (112d58.95mW)

>From a recent posting and attached map I note that you (collectively) have been predicting touchdown to be southwest of my offering (and searching accordingly). Two maps are attached differing only in zoom factor (TV01Emp1.gif and TC01Emp2.gif) that show my predictions. If Mosby Butte coordinates are used as an average of your current TD predictions, I suggest you move your search pattern roughly 13 miles ENE.

714. Meeting and CC/PS

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-09-11 22:07:53 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 714 Message: 714

First off, I feel sick about what has happened today. My heart goes out to the dead and injuried. I hope Americans will stay level headed about this and investigate the cause and determine the guilty party without harming innocent people, unlike the terrorists who did this.

Thanks John for bringing your SWR meter to tomorrow's meeting. I know the meeting will not be as light as usual.

I now have my new CC/PS sending complete GPS sentences without creating posits. It was amazing last night, I was able to see raw GPS sentences from the MIM module. When sending telemetry, the CC/PS sends an empty GGL sentence first. It's awesome. Next is a blackbox using the iButton EEPROM. Now you won't have to clean up a telemetry log, you just pop out the iButton and connect it to your PC.

I'm designing a backup board for the CC/PS that is mounted to the CC/PS. The backup provides telemetry and CW in case the CC/PS fails. It uses a DTMF decoder so you can send commands to it. The backup monitors voltages on the CC/PS. I'm also working on a heart beat monitor for the CC/PS. When done, there will be redundant GPSs and HTs on the capsule. You'll be able to monitor CC/PS function independent of the CC/PS.

for the new CC/PS design, you'll need an Alinco DJ-S11 and an Etrex GPS. Together they cost $200. In addition you need a SSC, MIM, and BS-2P that are monuted to the CC/PS.

It's great!

Paul

719. Next Launch

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-09-17 23:48:53 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 719 Message: 719

We need to think about a meeting for the next launch. Would next Saturdasy work? We need to determine how many people want to fox hunt the teddy bear. If we don't get enough, we'll still launch the para-bear, but I won't put a HT on it.

The next launch is planned for the last weekend in September. We'll fly a bear (to test cutdowns), a camera (to record the drop and test the modified ELPH), a camcorder to record an entire flight (but to only 50,000 ft), and a heat flow experiment (to test capsule construction).

We need to get more pictures of launch procedures.

Paul

Saturday works for me Paul... I plan on helping on the launch and recovery,
but not the foxhunt. I still need to get some gear together to do that.

Morning all-

Be careful when getting close to launch date. All VFR flights, ballooning included, are still grounded at the present time. This includes hot air balloons & unmanned He balloons. Contact the FAA for further details.

My company is effectively out of business here in Oregon, until the ban lifts. We have at least three flights scheduled for the next two months.

Last I heard, general aviation flights were allowed to resume last Friday or Saturday. The only exception is for within 25 NM around Washington and New York.

NWS has been flying balloons since last Tuesday, to my knowledge without restriction. I have heard no comments on loss of data around DC and NY.

724. IFR only

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-09-18 13:50:45 UTC
From: Mark Conner
Topic: 724 Message: 724

Ah, that's what I get for trusting the media. Here's the correct answer from the FAA - no VFR flying yet, IFR only.

http://www.faa.gov/apa/faq/pr_faq.htm
Frequently Asked Questions About Resumption of Air Service
Sept. 17, 2001

Are general aviation aircraft permitted to fly? For general aviation operators and pilots, the U.S. Department of Transportation has approved resumption of general aviation Instrument Flight Rules, or IFR, flights as of Sept. 14 at 4 p.m.
Eastern time. However, those flights may not fly within 25 nautical miles of New York City and Washington, DC. Those restrictions will be kept in place until further notice as officials continue to assess the recovery situation in those cities over the near term.

Pilots operating under Part 91 of the Federal Aviation Regulations, must be instrument-rated, must file IFR flight plans, and must receive a clearance before departure. Flights under visual flight rules have not been authorized.

General aviation IFR operations were approved Sept. 16 between U.S. airports to and from Japan, Canada, Mexico, the Bahamas, England, Scotland, Wales and Northern Ireland. These aircraft must be on an IFR flight plan and comply with all U.S. Customs Service notifications and requirements to land at U.S. airports designated as ports of entry.

On Sept. 16, the FAA ordered a temporary suspension of all agricultural aviation flights as part of an overall assessment of the gradual resumption of visual rule flights. Previously, these flights were cleared on Sept. 14 to resume services.

One of the engineers I work with couldn't go up Saturday because of the ban. They talked to the FAA & was denied permission. There is a hot air balloon company over in Newberg that is grounded also. They go up 7 days a week normally.

NWS is a government group & has different rules than the rest of us.

I will ask our director of flights to find out about unmanned balloons.

Greetings from the Montana State University group. We were to attempt a
100,000-foot flight this last Saturday, and I was able to get a NOTAM
approved with very little trouble. Their biggest concern was whether it
was manned or not! They said that the restrictions were incredibly tight
until Saturday, then most everything opened up. Maybe they're just not
worrying much about the airspace over Montana <g>. As it turned out, we
had a low pressure system that stalled in our area and we had to scrub the
launch. But we're still hoping to fly within the next two weeks. If
you're interested in seeing what we're up to, check out our website:

http://www.physics.montana.edu/borealis/

Clear skies!
Mike.

We'll hold our next meeting this Saturday, 22 Sept, at Idaho Pizza company in Caldwell. We'll discuss Jeff's capsule, the cutdowns, and out next flight.

Is there any help in searching for the lost capsule?

The new controller (CC/PS) design is going well. However, I've noticed that only every other telemetry is getting out. Can someone bring a portable APRS system so we can test the CC/PS? After the kinks are worked out, I'll arrange to make boards for anyone interested in making their own capsule.

Paul

From: Mark Conner
Topic: 732 Message: 732

I finally got around to digitizing some of the video shot for NSTAR 01-E
(the one that became a smoking hole - remember?). There are two scenes -
one of the first minute of flight, and one at burst and shortly afterwards.
There is both a low-quality RealVideo file and a high-quality (and large)
MPEG-3 movie for each one.
http://members.home.net/mconner1/nstar.html#01E

Still wish the batteries had lasted another 20 minutes.

Mark, Thanks for the FAA faq, Here is what it said Sept 20, 2001. I think the last paragraph is applicable to us.

Jeff, can you find what the Class B airspaces in our area are since they now extend to "infinity."

Are general aviation aircraft permitted to fly? For general aviation operators and pilots, the U.S. Department of Transportation approved resumption of general aviation Instrument Flight Rules, or IFR, flights as of Sept. 14 at 4 p.m. Eastern time. However, those flights may not fly within 25 nautical miles of New York City and Washington, DC. Those restrictions will be kept in place until further notice as officials continue to assess the recovery situation in those cities over the near term.
On Sept. 20, the FAA authorized limited return of general aviation Part 91 visual flight rules operations, or VFR, flights. VFR flights are now permitted for U.S. registered aircraft outside of "enhanced" Class B airspace; that is, Class B airspace within the lateral limits from the surface to infinity. No VFR flights are permitted over the top of Class B airspace, nor are VFR operations permitted from airports and airspace "under the shelf" of Class B airspace. In addition, several Temporary Flight Restrictions remain in effect. Civil aircraft VFR flight training operations are prohibited. Restrictions continue to apply to Part 91 VFR operations for banner towing, news reporting, traffic watch, airship/blimps, and Part 91 sightseeing.

Authorized operations outside of enhanced Class B airspace include aircraft maintenance repositioning, Civil Air Patrol, balloons, gliders, manufacturer production flight tests, mapping/photography missions, pipeline/powerline inspections, seaplanes, skydiving, wildlife management operations, and ultralights.

> The nearest for you guys is Seattle and Salt Lake City.

Okay, there's nothing by the FAA to stop a launch at this time.

I still have to make the teddy bear skydiver. I ran a test witht he cutdown device with a stop watch and it worked fine (it was odd, however). We now have sevral, independent cutdown devices.

I still need to run a 5 hour test on the CC/PS. My batteries gave out, so I'm going to try an RC car battery this week.

From: Jeff Melanson
Topic: 724 Message: 740

Hi all,

Here is my take on all this. IFR and VFR are rules used to govern aircraft and are covered in part 91 of the FAA regulations. We are flying an unmanned balloon which is governed by part 101. Specifically part 101.1 defines whether or not part 101 is applicable to us. Since we do not meet the requirements it is not applicable. I have cut and pasted the part describing the applicability below. If we were to exceed the described weight limits then we would be restricted from operating in class B,C,D, and E airspace as described in part 101.33. We do not exceed these weight limits.

?101.1 Applicability.

(a) This part prescribes rules governing the operation in the United States, of the following:

(4) Except as provided for in ?101.7, any unmanned free balloon that --

(i) Carries a payload package that weighs more than four pounds and has a weight/size ratio of more than three ounces per square inch on any surface of the package, determined by dividing the total weight in ounces of the payload package by the area in square inches of its smallest surface;

(ii) Carries a payload package that weighs more than six pounds;

(iii) Carries a payload, of two or more packages, that weighs more than 12 pounds.

?101.33 Operating limitations.

No person may operate an unmanned free balloon --

(a) Unless otherwise authorized by ATC, below 2,000 feet above the surface within the lateral boundaries of the surface areas of Class B, Class C, Class D, or Class E airspace designated for an airport;

I have not heard of any official ruling restricting kites, model rocketry, or unmanned balloons. Does anyone know differently?

Regardless of whether or not we can fly the balloons I suppose there are some concerns due to current events. I would prefer that the balloon fly well clear of any airport or any place that might cause some unwanted attention. What are your thoughts?

The following link gives the definitions of the various classes of airspace.

http://www.flightinfo.com/html/airspace.shtm

Boise Airport is a terminal controlled airspace and requires two way radio communication and a mode C transponder. To know where the controlled airspace is we would need pilots charts. I don't have one.

A mode C transponder is a device that give the tower three pieces of information. 1) It transmits a four digit number that is assigned to the pilot by the tower when he enters the controlled airspace. This number is transmitted every time the transponder is interrogated by ground equipment. This number is displayed on the controllers radar and helps him track the aircraft. 2) Range to aircraft. This is calculated by the amount of time it takes for the interrogation signal to travel from the ground equipment to the aircraft and back plus signal processing time in the transponder which is standardized at .063 seconds. 3) Altitude. A pressure sensor (usually an altimeter) sends altitude information to the transponder which is also transmitted when the transponder is interrogated.

Topic: 742 Message: 742

Most airports that have regular jet or large turboprop passenger service, or Air Force bases, have Class C airspace around it. For example, in our area Omaha/Offutt, Lincoln, and Des Moines have Class C airspace, typically extending 10 nautical miles around the airport and extending about 4000 ft above the surface (here, up to 5000 ft MSL).

I have only conducted one launch within Class C airspace, and had contact with the Lincoln tower prior to launch. We have enough suitable launch sites around Omaha that the flights will not go through the Class C airspace either on ascent or descent. I have the number for the local TRACON's radar room should a flight intending to pass over Class C airspace end up passing through it instead.

743. Audio Beacon

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-09-25 03:44:35 UTC
From: K7JPS - John
Topic: 743 Message: 743

Paul,

I picked up a 3-28VDC, 2.8KHz Piezo buzzer (part # 273-066) at Radio Shack that can be used for an audio beacon. It has a min level of 81 dB and only draws 6mA. If you tell me what parts I need to create a circuit for it, I should be able to make it work for TV01G.

While I was there I also picked up a window alarm (part # 49-406). It uses one piezo as a shock sensor, and has a 120 dB speaker. I've dismantled this alarm and am wondering about modifying it so that it only activates on landing. The specs for this device can be found at http://support.radioshack.com/support_security/doc39/39504.htm

Six mA? The one I picked up operates on 150 mA! It sounds like
we can connect a battery snap to it and fly it. can I stop after work
and see it?

The NWS is predicting the rain will move out by Saturday. Lows will be above freezing, but not by much. Today's winds puts the capsule down almost due north, at a range of 49 miles. Over the next few days a high pressure ridge will park itself to our east and stay there. This will move the landing site more towards the northeast. The range to landing may not change much.

Shennans closes at 5:30 PM. I should be able to get there before they close, but don't have the Jeep the carry the tanks. Who is going to get the tanks? I'll put some money in the TVNSP account after work.

The teddy rabbit cutdown is complete. I ran a test with the stop watch and was happy with the results. I'll add a little more plywood to the sides tonight. I'll look over John's audio beacon and set up a boom and battery for it. The rabbit's parachute is complete, but I'm concerned it may be a little too small. I may tey to sew a second 'chute tonight.

The MRF looks for Saturday looks like the high level
winds will be blowing to the Northeast in the morning
changing to Southeast in the afternoon. The pressure
gradient doesn't look very large.

Hi TVNSP Group,

My camcorder has come back from repair. I will test it and make sure the batteries are fully charged. I am almost done with the new wiring harness. I am in the process of adding a second antenna boom for the backup radio. It is almost complete. I will reprogram the TNC for wide 3-3 and increase the transmit rate from 1 minute to 15 or 20 seconds. Paul, I still need the battery pack for the beacon.

Topic: 751 Message: 759

Hi John,

The CW beacon will be on my capsule with the camcorder. Yes it will have Paul's call sign KD4STH. My tracker will be KD7INN-11. There are 5 items to power up on this capsule.

1) The GPS (Before closing the top)
2) The TNC (Before closing the top)
3) The APRS radio (On the control panel)
4) The CW beacon (On the control panel)
5) The camcorder (Access from the side panel)

Paul will have to look at the rest of the checklist for his capsule.

I have just completed and tested the new wiring harness. It is working good. I used a Pfranc connector for the GPS. This saves some weight because the store bought cable was too long and heavy. This also allowed me to eliminate two DB9 connectors. I also added the capablitiy to power the GPS externally should we ever think it's necessary.

I haven't been able to FTP to the website, so there have been no updates. We'll launch Saturday at about 8:00 AM. This means we'll begin filling around 7:00 AM. We have yet to determine the launch site, although the Jordan Valley area looks good. all you need to do is meet us at the launch site. We may get together tomorrow evening for a review. We're welcome to attend that.

Paul

Hi Bill,

Launch is scheduled to be in the Jordan Valley area (most likely Succor Creek Junction) at 8am on Saturday. We plan on being at the launch site at 7am to begin filling and preparing the capsules. Recovery should be in the Treasure Valley. This flight is carrying a camcorder, some experiments, and a stuffed animal with a parachute which will be dropped from the capsule to test the cut away device. Everyone is welcome to come along and the event should be finished up by noon.

In regards to your ps, TVNSP is always happy to accept dontations to help cover the costs of balloons and helium which averages about $200 per flight!

Hope to see you at the launch.

Stephanie

Winds aloft today are stronger than the predictions for Saturday morning. Today's winds put the capsule downrange 77 miles at a bearing of 40 degrees (NE). Saturday's flight will have close to the same heading, but land closer. Has anyone tried the prediction from Succor Creek?

We have the helium. I made the battery for Jeff and the radio beacon. Jeff, I'll drop it off tonight. The audio beacon that John picked up is completed. I mounted my controller to a plastic board, but still have to finish packing the capsule. I also have to load up a roll of film.

I'd like to meet on Friday evening. I assume 7:00 PM at Idaho Pizza in Caldwell is good for everyone. Let me know otherwise.

Paul

I ran the calculations for this morning. The flight
data is Bearing 53 degrees, flight time of 92 minutes,
and a range of 81 miles. If launced from the Succor
Creek area the landing point would be lat 43.9333
degrees and long -115.7601 degrees. The MRF for
Saturday shows light NE Winds in the early hours
changing to basically east in the afternoon.

Anybody else come up with a prediction yet?

769. Saturday's Launch

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-09-27 18:03:14 UTC
From: Bill Herrmann
Topic: 769 Message: 769

Thanks for all the responses!

Is there a good way to localize the launch site for sure Saturday morning? A voice frequency or tracker to home in on?

I won't be able to make the Friday evening meeting, (It would be politically incorrect for me to do so.) but thanks for the invitation.

Any tips on gear to bring? Is the parachute bunny going to have a transmitter? (If so what frequency?) What time is the cut-down anticipated to occur?

Perhaps most importantly: Are there plans for other launches this fall? (schedule is looking tight on Saturday)

> Is there a good way to localize the launch site for sure Saturday morning? A voice frequency or tracker to home in on?

If we launch from Succor Creek, then drive south on 95 (from Marsing) into Oregon. There is a sign in BLM lands that will be on the right side (west). We just pulled about 1/2 mile off the road. We'll be communicating on the 24 repeater.

> Any tips on gear to bring? Is the parachute bunny going to have a transmitter? (If so what frequency?) What time is the cut-down anticipated to occur?

An HT definitely. Our last local flight landed outside of Middleton, so it was easy to recover. You'll want boot and long pants. Proably bring something to drink and snack on. We've had a few flights that required a little bit of walking.

> Perhaps most importantly: Are there plans for other launches this fall? (schedule is looking tight on Saturday)

We may try on Sunday. After that, it won't be until the end of October before we launch again.

Paul

The winds and weather are predicted to be fine for the launch. Looking more carefully at the MRF reports, the winds are about to make a significant change in direction. Any prediction using current winds would be inaccurate. Mark ran a prediction for us, but I don't have it now. We need to run the prediction again with the predicted winds. At 12Z on Saturday, the winds will be from the NW. This will push the balloon to the southeast. If we launch from Jordan Valley, Succor Creek, or Rome, the winds will put the capsule down in the Owyhees. I think we should launch from Fruitland or Ontario.

Inputs?

We'll meet tonight at the Idaho Pizza in Caldwell. I have completed the capsule and have preped the teddy rabbit. I have the battery for Jeff and the radio beacon. I need to power up the capsule when someone is running APRS. There is also an audio beacon on the capsule. The camera has a new roll of film. That should be everything.

Mike picke dup the helium and Jeff has the balloon. Thanks to Mark and NSTAR for the balloon.

Paul

773. Re: [tvnsp] Status, 27 Sept

I am concerned about launching from the
Ontario-Fruitland area. If the winds are toward the SE
then the balloon has a good chance of landing in the
Orchid Training area, most of which is off limits. If
for some reason the wind is more from the west then we
are in the mountains north of Idaho City. I still
believe we are best served to launch from North of
Rome or north of Succor Creek. Maybe the Wilder area
would be a good choice.

778. Status, 28 Sept

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-09-29 05:37:41 UTC
From: K7JPS - John
Topic: 774 Message: 778

At our meeting this evening we decided to move the launch site to the Swan Falls overlook South of Kuna on the Snake River. An estimate of the lat/long is N 43.25 W 116.37 Elev 3000. We will begin the balloon fill at 7:00am and launch at 8:00am MDT (1400 UTC). We will be using the .24 repeater for chase communications.

Between Friday morning's and Friday evening's NWS data, the winds have moved from a bearing of 35 to 62 and slowed significantly. We are hoping that the winds will continue to change direction during the night so that the heading is between 90 and 135, with a touchdown East of Mtn Home. If not, the current predictions would see a touchdown north of Pine.

Stephanie, If you read this, please remember to bring your directional antenna - Like I need to ask after the last launch :)

I was able to watch the last 40 minutes of the flight from home here in Emmett. Looks like it was a successful mission !! The positon reports were also gated to the internet at a very good rate of update. I've attached the flight positon reports in a text file that can be re-run on WinAprs.

Tim, N7UBO........

781. TV01G Landing Photos

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-09-30 06:27:19 UTC
From: Stephanie Steele
Topic: 781 Message: 781

Hi everyone,

We had a great time today. Thanks to everyone for being such a good group to work with. I checked my camera when I got home and have a couple of really poor quality 5 second mpgs of the capsules and parachute on decent. I also have one still that you can just make the package out. I appologize but the lighting was just not good with the desending capsules so near the sun. Had I thought of it, I could have changed modes on the camera and possibly had better results, but I was so enjoying seeing the desending package that I didn't think of it. A sunshade for the lens might also have been a great help, but maybe next time. I also have a number of photos taken on the ground. If anyone is interested, please drop me a note and I'll send them to you by email.

783. TV01G - Video from liftoff to landing!

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-09-30 16:42:28 UTC
From: Jeff Melanson
Topic: 783 Message: 783

Hi all,

TV01G was a successful flight. Details will be posted later. We have watched the video tape. It is a pretty good video. There was one glitch. The focus was set to AUTO instead of manually setting it to infinity. During the flight the camera was having difficulty focusing. Even so the video looks pretty good. The landing looks excellent. You can even see the shadow of the parachute moments before touchdown. The max altitude was 44,111 ft. The video image is very stable during the entire flight. Even when the ballon burst it remained stable. The video capsule was the top one. We think the top capsule is more stable than the bottom capsule. We use four link lines between the capsule's. They were about 24 inches long. This flight was flown on the 350 gm balloon donated by Ralph Wallio. Mark, we did come close to but missed the power lines. We will send both of you a copy of the video. At one point the chase crew was almost directly under the balloon. We got out and watched it descending from about 11,000 ft. We didn't get to see it land. A farmer watched it land but stayed well clear of it because it made him a little nervous.
Next month we are going to fly the same package with some minor changes. We will be using a 1500 gm balloon. I will set the camera for a 4 hour recording time. The microphone for the camera is inside the capsule. I only made room for the lens to peek outside. As a result the microphone picks up a high pitch wine from the camera. I will modify the camera housing to expose the microphone to the outside. We want to replace the CW beacon with a repeater and get the Montana group to launch at the same time with there repeater. We did see Montana's balloon on APRS while they were near maximum altitude. It was 372 miles from us. I have 87,533 ft. for an altitude but I think that was after burst. I believe it was over 90,000 ft.

Congratulations on the great flight! I'm looking forward to seeing the videotape. I had an appointment Saturday morning so I couldn't watch the data on the Internet.

What kind of video camera are you using? I've been using a VHS-C camera which has a maximum of 2 hours recording time.

I'll be sending Paul a copy of the NSTAR 01-E videotape soon.

I'm slowly getting parts together for the next NSTAR capsule. I have a BS2p on order, purchased a Canon Elph LT on eBay, and got another Yaesu VX-1R to use for a backup APRS beacon. The backup beacon will consist of the VX-1R, a Motorola Oncore M12 GPS unit, and either a MIM module or a TinyTrak II. This should give me a fully-redundant APRS beacon for about 8-10 ounces (depending on batteries).

Hi Mark,

The camera is a Sony Hi8 TRV68. On it's first flight it went to about 85,000 ft. The little black and white viewfinder failed. This flight was 44,111 ft. Nothing failed. We will be sending back to 85,000ft on the next flight. I'll let you know if the viewfinder fails again. The failure could have been a coincidence. We'll find out soon.

Sorry to the group. I just realized that I sent these to the list
.... twice! Oops. I'll send them direct next time.

Nice flight!

This is more of what we get in the midwest. First the failures with my capsule. The CC/PS (flight computer) operated well, but not without a few problems. Most of the GPS sentences were sent to the MIM, but a few characters in the begging of each sentence didn't show up on the log. That's one software error I need to look at, it shouldn't be a problem with the hardware. The CC/PS took pictures up to 35,000 feet, when the teddy rabbit was released. However, it didn't take pictures above that altitude. The cause is another item to research. Unfortunately the timer released the rabbit a minute or so before the CC/PS. So we didn't get pictures of the rabbit making his plunge to the ground. We should have set the time for 15 minutes later.

Both cutdown devices worked as designed. However the CC/PS operated one melted a lot of styrofoam. I checked the flight code, the CC/PS should have operated the cutdown for only 1.5 seconds. I did set a bit on the teddy rabbit code, so it should have only operated once. More research.

I'm putting together a list of photographs. I'll make that available in the next day.

Paul

Paul and the group,

I am working on "Photo Analysis" of the stills taken on the flight, so far I have positively ID'ed the first 10 pictures locations. The rest are a little harder, with the altitude and lack of good roads to identify the location. I will send a list of the pictures and what they were taken of soon......

Great flight!!

Jeff,

Ok, I am game for this Sunday...just give me a time and place to meet him!
If he needs to get flying early in the morning, say around 7am, I should be
able to get out of work early on Sunday morning...if he needs to talk to me,
my home phone number is 846-9219.

Hi Mike,

Unless the other person is small I would suggest you went by yourself. The back seat of the plane is not very roomy. Just ask John Stone. It's also good to keep the weight down in the plane. Call Western Aircraft at 338-1800 and ask for Steve Strom in inspections deptartment. He may want to meet with you first and see your search plan. His airplane is hangared in Kuna but he may want to pick you up at the Nampa Airport. This is because the Kuna airport is short. The more weight you have the more runway you need. Does someone have a tracker that Mike can take with him? Can those of us who committed some gas money get that to Mike Garske ahead of time? I pledged $25 there were 3 others. We might need one more pledge because this flight will be longer than the last one.

Jeff,

I am at work this next couple nights until Sunday morning, so I probably can't meet with him before then. I will give him a call before work tonight around 4pm.
As for the gas money, I can cover it until we all meet for the next launch at the end of the month. I know I will pay $25, and I know Stephanie has chipped in already too. And if it goes over, I will not have a problem with that....I am really looking forward to flying!

Also, what was the model of your laptop again, Jeff? I think I looked up the right one on Crucial's website, www.crucial.com. For around $100 you can max out the memory to 80MB. Pretty cheap upgrade right now!

For those of you who have copies of the photos from the flight, this is the list of headings for each of the pictures. The bearing is the direction the camera was pointing so that you can orient them to north. I found matching marks to overlap all but the first photo.

1) 270? 8) 100? 15) 010?
2) 090? 9) 110? 16) 270?
3) 080? 10) 310? 17) 220?
4) 080? 11) 140? 18) 060?
5) 270? 12) 150? 19) 240?
6) 180? 13) 010? 20) 300?
7) 010? 14) 200? 21) 210?

Topic: 781 Message: 807

Hi Steph

That was pretty interesting.

I'm just learning about digital photos. My understanding is that jpg formats are already compacted. So, is there an advantage to sending these in a zipped format? It didn't look like the file changed much.

I would like to know how to zip stuff like spreadsheets. There are times when I send work home. That should really be in some kind of secured file I guess. Don't know how to do that either. I could get real backwards and just use a floppy. But what fun would that be?

Glad you had fun on the outing. I'm a little behind, as I'm just now reading the mail. It's been very busy for me at work. Even working nights at work. Not good.

Mike,

Both of Paul's capsules are white with black tops. I think the parachute is blue and something like red.

Tomorrow (Saturday morning) I will program my balloon tracker so you can take it with you. I will change the symbol to an airplane and program your call sign into it. You won't be able to send or receive messages but we can track your progress. How can I get the tracker to you? Don't forget your binoculars and extra water!

Mike,

I have just finished reprogramming my tracker for your flight on Sunday. All you have to do is take it with you and turn it on. The rest of us can track your progress. The call sign will be KC7DPD-1.

It's a red and blue parachute, both colors are dull and not bright.
There will be two white boxes attached. The boxes have black
tops and bottoms. The boxes are one cubic foot in volume.

Good luck on the search.

I gave one talk at the ISTA conference yesterday. It was suggested I give a workshop to help others build capsules. This way people who were not local could get help constructing a near space program. So I'd like to plan two construction meetings every month. the first would be located here in the Treasure Valley. Two weeks later I'd like to travel to a second location in Idaho, proably the Magic Valley. What was covered two weeks ago would be covered at this meeting. Except this second meeting would also cover some of the basics on launching and tracking capsules. The second meeting would be several hours long to justify the travel time.

We're looking at a launch in late October. construction meetings would begin in November. I'll begin putting together a complete list of materials this week. Right now though for the airframe you'll need the following.

Half a sheet of 3/4" blue or pink styrofoam.
(Get this at a home improvement store. It's the type used for insulating homes)
A space blanket and two yards of wedding veil material.
(Both of these are available at Walmart)
A roll of wide mailing tape
(I use the transparent stuff, which is available at Walmart)
A yard of 1" and 1/4" foam rubber
(Available at a fabric store)
Hot glue and silicone rubber adhesive
(Hardware store)
Two yards of ripstop nylon, AKA spinaker nylon, the kind used to make kites. Decide on a color scheme for your capsule, first
(Available from Into The Wind, a kite store in Boulder Co, they're on the web)
One yard of 1" wide dacron tape
(also available from Into The Wind)
Eight 1" jump rings, the kind used on key rings
(At your local hardware store)
A sharp exacto knife, with extra blades
(At a hobby store or hardware store)

For the avionics, order the following
Etrex GPS
(I found one from GPS Now for $109)
PFrank Etrex cable
MIM Module

(www.aprs.com?), Bob Buringa is selling them now
Basic Stamp 2P
(www.parallaxinc.com)
Serial Sevo Controller
(order the SSC II from www.seetron.com)
A ULN2803
MAX186
(ask for a free sample from www.maxim-ic.com)

That should get you started.

Paul

Hi All,

Mike has picked up the tracker for his flight tomorrow. He should be departing Nampa airport at about 8:00 am. Monitor his progress on APRS 144.39. His callsign is KC7DPD-1. He will also be monitoring the 147.24 repeater. Give him a call. A couple of us should log his progress for future analysis. Does someone have the Twin Falls repeater frequency? Maybe you can pass that on to Mike in the morning.

Just out of curiousity - have you tried the Tripmate units? Refurbished from DeLorme they're $50 and no additional cable is needed. I've used one with with both a TinyTrak2 and with a KPC3+. (You do need an adapter cable there, but it's basically a specialized null-modem and I can tell you how to build one.) With minor work you could power them from you main power source or they run a long time on 4 AA batteries. For tracker use where you don't need a display they are darn hard to beat.

I mentioned this GPS to Paul a couple of weeks ago. One minor problem,
it is only good for about 50,000 feet,according to Paul. I was hoping to
use one to keep the expense down on my future capsule. Not sure if it
powers back up after loosing lock on ascent. Other users can fill us in
on this.
It does make a nice inexpensive gps for land use however.

I flew a Tripmate on a couple of my early tandem flights with NSBG. I had some problems with spurious readings on speed, direction,and altitude above 60,000 ft, but I wasn't sure if that was a software limitation in the Tripmate or some other problem. It wasn't like the problems began and ended exactly at 60,000 ft. During descent the Tripmate did begin working properly again.

Aside from that, there are two other reasons I don't like Tripmates:

1) Battery consumption. A Tripmate uses 180 mA at 5V. Most other receivers are 30-50% of that.

2) Warm-up time. Tripmates use the last "stored" position to initialize, and don't have internal timekeeping. So it has to get time from the satellites and then uses its internal stored position to help orient itself. This can take quite a while to get a first valid fix. If power is interrupted during flight, you could go a while before you get good positions again. Storing the position in the Tripmate is done by sending a setup string to the unit.

So Tripmates will work, but I think it's worth the money to get an Etrex or GPS-35. The latter has 3-D velocity measurements, which may be useful for your controller software.

Hi All,
Mike is back from the aerial search. The capsules were not found. He said if the capsules were there they would have seen them. They had good visibility. The new search area was on the edge of the populated area. Someone may have picked it up. Mike does have some aerial photography to show us. Is anyone interested in a get together this Saturday or a weekday night? We can discuss the search flight, our next balloon flight, and the upcoming classes. Let's try to pick a night that everyone can participate.

Hi Jeff,

As a final effort, I would telephone all the local agencies in the area, both Sheriff and PD's to see if anyone turned it in. It is very likely that if it was turned it that no one would call as lost and found takes a pretty low priority in most departments (mine excluded of course!). Most of the search area is going to be Sheriff's department country but we have had people bring 'found' items to us that they picked up many miles outside the city because we were the first agency they spotted.

Also, how about also trying to do a press release to radio and tv in the area and play up the 'educational material' aspect of the package. If a low life picked it up and has it squirrled away, it might make them cough it up. Also, if it's in some kid's room mom or dad might see or hear the spot and make them return it. Just some final thoughts.

One balloon group discovered the tripmates don't work above
32,767 (number of bits in a word) meters. Few flights get this high,
but it takes away your chances of making a record altitude.

I straighten out a telemetry problem on the new CC/PS last night.
in the process however, I discovered a limitation with the MIM. It
can only store 65 characters. That's not enough for a complete
GGA or RMC sentence. Does anyone know how APRS will
respond? APRS will see a GGA sentence without the * and
checksum.

Or, has anyone seen a MIM module display a position as a tracker
in APRS?

Thanks,
Paul

825. FW: Gas-Filled Balloons Cause Stir in Midwest

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-10-08 23:28:53 UTC
From: Mark Conner
Topic: 825 Message: 825

Got this from the Fox News web site. If you were following this on APRS, the balloon landing in southern Minnesota had KD5ONM-7 for a callsign.

There are two others still airborne - look here for their current positions:
http://www.findu.com/cgi-bin/find.cgi?dc2eh-5
http://www.findu.com/cgi-bin/find.cgi?KC5VWK-7

Something to think about for future amateur radio balloon launches - seeing one land might cause more of a stir amongst the public than it would have six weeks ago.

73 de Mark N9XTN

http://www.foxnews.com/story/0,2933,36033,00.html
DES MOINES, Iowa - A gas-filled balloon race that originated in New Mexico caused some excitement Monday when some Iowans and Minnesotans, with a heightened sense of alert from terrorist activities, called authorities saying the balloons seemed suspicious.

At least three high-flying gas balloons floated across the region, sparking several phone calls to sheriff's offices.

The balloons were spotted in Pocahontas and Kossuth counties in Iowa before touching down in southern Minnesota.

Kossuth County Sheriff Kevin Van Otterloo tracked one of the balloons, which he estimated was traveling at 40-50 mph.

"It's a white silver balloon. We looked at it with a spotting scope and binoculars and couldn't tell if it was occupied," he said.

Van Otterloo said other agencies were notified, including the Iowa National Guard and the Federal Aviation Administration.

"I think it's kind of bad timing by some balloonists," Van Otterloo said, speaking of the heightened security in the wake of the Sept. 11 terrorist attacks and the U.S.-led retaliation on Afghanistan on Sunday.

All three balloons landed in Minnesota, one near Gaylord in Sibley County and the other two in Faribault County near Blue Earth.

The balloons were part of the America's Challenge race that began over the weekend in Albuquerque, N.M., said Tim Boyer, a spokesman for the Minnesota State Patrol.

The distance race began Saturday night when 19 gas balloons lifted off. Pilots in the international race came from as far away as Canada, Britain, Germany and Austria.

"The goal is to fly as far as you can with the fuel you have to begin with," Boyer said. "One of the three indicated they had been flying for the better part of two days."

Boyer said he heard there were at least nine other balloons were still in the air Monday, and residents shouldn't be concerned.

Gas-filled balloons are round and typically rise higher than hot air balloons.

OK, let's make it Saturday. I believe the usual time and place is 7 pm at the Nampa/Caldwell Idaho Pizza. Who will be attending?

I have made 8 video recordings. I have bought 4 more tapes and will finish them this week. Is 12 enough? We need enough for our group and to mail to Mark and Ralph and who else?

I believe four of us pledged $25 for the fuel. Mike, what was the actual cost?

Bill Herrmann, come to the meeting! We'll be more than happy to show you what it's all about! Hope to see you there!

Paul indicated he started material list for capsule construction. I had also started a material and tool list. I will bring this list to combine it with Paul's. We still need a place to do the work. Any ideas yet?

Mark,

On our last flight we flew(floated) over the National Guard Maneuver Area, then very near the Air Force Base Gunnery range(maybe over it), then near the Mountain Home Air Force Base. The recovered capsules did not have any holes in them and we saw no fighters on the video. I have to admit that I was nervous about it but it turned out to be a great flight.

What would be good timing? If we are to get things back to normal then the show must go on! Will things ever be normal?

Group,

Well, Saturday does not work for me....its a work night, but don't change only on my behalf. I gave Steve the pilot, $100 for the fuel....at $2.00 a gallon, avgas is expensive!

About the search flight......I believe if the capsule was still laying out in the desert, we would have seen it. The 3 prediction points that Paul had we flew a pattern about 3 miles north and south of, and about 2 miles east and west of it, including directly over them. This area was on the edge of some farmland and civilization, along with dirt bike/4x4 trails out there, so the chances are very good someone found it before us. Also, if it had landed in the lava fields, it would definitely stood out like a sore thumb....the area is black as night from the air.

Anyway, I have gathered materials to construct a parachute so far. I found ripstop nylon at Jo-Ann Fabrics for 5.99 a yard, versus 8.99 from Into The Wind, on the internet. Breaking out the sewing machine soon!

Jeff, when do you want me to bring by the tracker I borrowed, anytime this week before Wednesday night will work for me. Give me a call!

Mike KC7DPD

Hi Mike,

I work nights now. I leave at about 2:30 pm and return at midnight. How
about noon tomorrow if that works for you?

Warning!!!!!
Mike is right, use the Jo ann ripstop for the parachute. It's not
coated and has a softer feel that opens properly. The Into The
Wind is coated and is not good for a 'chute. I use it for the
abrasion jacket.

I have found "rip-stop nylon" and "flag cloth" which is a rip-stop nylon also and to me feels like the parachutes that Paul has. Does anyone know if "flag cloth" is the right stuff or will work. It comes in a lot more colors than rip-stop.

How much material do you need for a parachute. I am interested in total yardage and how many yards per panel of the chute as I want to make one with multiple colors.

Flag cloth may work well for a parachute. The important thing is to
have material that does not let air seep through. I imagine flag
cloth is like that.

Let's see.
There's eight gores on a 'chute. Each gore is just over 5 feet long
and about 2.5 feet wide. Each gore is shaped like a curved
triangle. I figure it will take 2 yards of fabric for each gore, or about
16 yards total. My fabric was about $6 per yard. I also alternated
colors between gores. My first 'chute even alternated colors within
the gores.

We need to get 200 pound test dacron for the shroud lines. I'll
arrange to order it from the kite store.

Paul,

What size is the parachute we used on the TV01G flight? I picked up 3
yards each of red and yellow ripstop, and according to your calculations, I
need to go get more!

The parachute is 7 ft across when opened.

I'm confused. If the parachute is 7 feet across when open, why are the sections 2.5 x 5 feet each? Wouldn't that make it 10 feet across?

Some of you may be interested in a new group forming. Micro controllers are used in many fun projects, including balloons.
If you are interested in attending the first meeting of a group to learn and share information about programing small microprocessors, you are invited to attend our first meeting. We will meet at the Idaho Pizza Co. in Meridian this Wednesday (tomorrow) at 6PM. This is about an hour before the VOI club meeting. For some of use this will not add an extra night out. Programing and circuit building for BasicStamps and PICs will be the main interest. Please come or at least let me know of your interest.

Remember the parachute is a hemispherical cap. The diameter at
the "opened" equator is 7 ft, but the semicircumfrence is 10 feet.

Being picky here - that is the largest number expressed with 15 bits and there are 16 bits in a 2 byte word. It's the largest signed integer in most implementations so I suppose the tripmate must support negative altitudes. <grin>

Yes, I are a computer programmer. <grin>

Bill

p.s. 65535 is the largest unsigned integer expressable in 16 bits.

From: Jeff Melanson
Topic: 719 Message: 855

Hi all,

The next Near Space Capsule flight date is not yet finalized. The choices are Oct 27th,
Nov 3rd, or Nov 10th. The date will depend on two things. 1) The arrival of the thermochrons and 2) the groups personal schedules. The thermochrons are expected at the end of the month. Since this is the last flight of the season let's pick the weekend that allows maximum participation. Everyone please reply and indicate the weekend or weekends that are best for you.
Randy and Stephanie, Paul has your video tapes. Mark Conner and Ralph Wallio, Paul will be mailing your copy's out shortly.
Paul purchased a 1500 gram balloon for an expected 85,000 ft flight. The balloon he purchased is thicker walled than previous ones and may go higher.
This flight will include a cut down device to separate the balloon from the parachute. It will be operated by a timer which will be set at 2-1/2 hours. If the balloon becomes buoyant the cut down device should bring it down. If we have a normal burst the cut down device will still separate the load line and what's left of the balloon from the parachute. Future flights (next season) will include computer control of the cut down device.
This flight will also include a simplex repeater. The frequency is not yet determined. We will want to spread the word.
Next Saturday we will be testing parachutes. Plan on meeting in the "Paul's Grocery Store" parking lot at 1 pm. We need several people to assist with this test.

The pager is ready for Jeff. His capsule will carry it as a test of the paging cutdown system. Jeff, let me know where you'd like me to drop it off. It inclused the 152 MHz dipole antenna.

I have some white plastic beads that turn colors when exposed to UV. I'd like to mount a couple in front of the camcorder. They can be placed off to one side so they don't interfere witht he rest of the view. The beads have a hole in them, so they can be strung together on a dowel.

I'll start the new updates on the webpage.

This next flight should make 90,000 feet. We need to put 3 PPL into the balloon. so plan on an ascent rate closer to 1000 fpm. As far as I know, thios will be the first time a thick-skined 1500 gram balloon has been flown by amateurs.

Paul

I just got back from visiting the web site, and would like to link up with the webmaster. There was nothing on the site or in the source I looked at to indicate who in particular to send this to, so I'm trying the list.

I would very much like to recommend that at least on the TVNSP home page, a title be added to the page. Otherwise, when you bookmark the page, there's nothing in the listing to indicate what that bookmark is for. A simple tag is all that's needed, and can be added to the very top of the page, before the existing page code:

<title>Treasure Valley Near Space Program</title>

Adding that one line will also add that title to the browser window, which is more friendly IMHO.

Date: 2001-10-17 20:18:00 UTC
From: John Knapp
Topic: 874 Message: 874

Unless it is windy and raining, we are still planing on doing the parachute test on Saturday. Lets meet at Paul's Market in Kuna at 1:00pm. We can go from there south towards Swan Falls. The highway is straight and there shouldn't be a lot of traffic on the road. I will need two brave individuals to help me in the Jeep, dress warm. There is no heater. Unless I hear otherwise, I will monitor the 24 repeater.

Seen you then

Nice to know I guessed correctly! I figured that the reason for meeting at Kuna was to make use of Swan Falls Road!

Can't promise to provide two bodies since I don't know how this parachute testing is organized, but I'm going to be there to help, and hope to have my son with me. If that's where we get assigned, count me in. I'll have my parachute along as well.

Question: What length line should I attach to the parachute for this testing? Or are you going to provide a standard line we attach the parachutes to?

Well, John disagreed with me, but I think the 'chute should be 10
car lengths behind the car. John's car is low, so should create
less trubulence. I'll let John jump here and explain his
reasoning. We want to be clear of it when testing the 'chutes. By
the way, I'll be bringing the standard line to drag the 'chutes with.

879. (Fwd) Pager Cutdown

This weekend is the parachute testing. I need someone to bring a full tracker. I still haven't tested my new CC/PS under APRS. I need to do this before we start classes. No sense in having people build flight controllers that won't work properly.

The first weekend in November is a workshop for me. So I can't launch that wekend. I'd rather the workshop came out to see the launch, as I think they'd learn more.

If by tracker you mean a mobile tracker, mine will be there. It's tied to my Geo Tracker in that it's mobile radio-based as opposed to a HT. Will this do? I can also bring the laptop and thus make it a full APRS+SA station, but not a tracker at the same time. Is this what you're after?

Just got back from moose hunting so i am behind on a lot of happenings with the balloon group. My only guaranteed opening for ballooning right now is the 27th. After that more hunting and steehead fishing is in the works for the month of Nov. I know my priorities are screwed up, but ballooning comes after these favorite fall events of mine. If a weekend is open,i will let everyone know on a week by week basis for now.

Helium is a hard habit to kick sometimes <:)

I want to run my flight controller again and see if it shows up under
APRS. So I'll need someone with a laptop and Street Atlas.

887. RE: [tvnsp] Next Launch

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-10-19 05:23:35 UTC
From: K7JPS - John
Topic: 719 Message: 887

With closing on a house the end of this month and moving in the first weekend of Nov, it will be 11/10 before I am available for a launch. I would prefer to see the group get one last launch in before the weather turns, so go without me and I might be able to do some mission control if the laptop isn't packed away. I will not be able to make the parachute testing this weekend.

Subject: [tvnsp] Next Launch

Hi all,

The next Near Space Capsule flight date is not yet finalized. The choices are Oct 27th,
Nov 3rd, or Nov 10th. The date will depend on two things. 1) The arrival of the thermochrons and 2) the groups personal schedules. The thermochrons are expected at the end of the month. Since this is the last flight of the season let's pick the weekend that allows maximum participation. Everyone please reply and indicate the weekend or weekends that are best for you.
Randy and Stephanie, Paul has your video tapes. Mark Conner and Ralph
Wallio, Paul will be mailing your copy's out shortly.
Paul purchased a 1500 gram balloon for an expected 85,000 ft flight. The balloon he purchased is thicker walled than previous ones and may go higher.
This flight will include a cut down device to separate the balloon from
the parachute. It will be operated by a timer which will be set at 2-1/2 hours. If the balloon becomes buoyant the cut down device should bring it down. If we have a normal burst the cut down device will still separate the load line and what's left of the balloon from the parachute. Future flights (next season) will include computer control of the cut down device.
This flight will also include a simplex repeater. The frequency is not
yet determined. We will want to spread the word.
Next Saturday we will be testing parachutes. Plan on meeting in the "Paul's Grocery Store" parking lot at 1 pm. We need several people to assist with this test.

From: verhap@occ1.sd01.k12.id.us
Topic: 889 Message: 889

Jeff and I just fdinished running a test on the newest CC/PS. Even though the MIM module can only send the first 65 characters in a GPS sentence, APRS displayed the position properly. So I'm going to announce the new flight computer ready.

I need to get a count. How many copies of the board do I need to shoot?

Mark, you asked about the old design. I think I still have the mask, but I'll recommend you get two copies of the new one. In the new design you can leave out the MIM and connect a KPC3 to the board.

I sent out everyone's videos yesterday. The Pony Express leaves Idaho sometime next week.

I need to get Mr Kelly's email address. I'd like to make a copy of the video for him.

We ran a few tests on parachutes yesterday. Dragging a parachute behind a car doesn't work. I managed to get a couple of chest compressions in the process. At about 50 pounds, the scale's hook bent. I think the scale is still alright. I should know later this week. The moral of the story? Don't stand behind a roll bar when dragging a parachute.

Paul

Hi TVNSP group,

Paul and I were discussing the next launch schedule. The 27th is out. The thermochrons aren't here yet. Also we will be doing some more parachute testing on the 27th with an entirely different method. The 3rd is out. Paul will be working that day. The 10th might work but the 17th may be better. I'm trying to adjust the schedule for maximum participation. If we delay one more week to the 17th then Stephanie and Norma can participate. I need to know if that date will work for everyone else. Please let me know right away.

This is what I have so far:

10th 17th
Paul Y Y
Jeff Y Y
John K Y ?
John S Y ?
Mike G N ?
Randy N ?
Stephanie N Y
Norma N Y
Bill Herrmann Y ?
Bill Blohm ? ?
Doug Rich ? ?

Paul,

Is this list of payloads for the next flight correct? Any changes?

Upper Capsule:

Camcorder - Set to 4 hr. recording time.
Cut down device controlled with pager.
(This will drop a small item on a parachute.
The purpose is to test the pager reception at altitude)
Beads that change color in ultraviolet light.
(Mounted in field of view of camera)

Lower Capsule:

Pauls new controller.
Geiger Counter
Simplex Repeater

Above Capsules:

Thermochrons in four boxes.
(To test insulation properties of construction materials)

Above Parachute:

Cut down device on a timer
(To prevent long flights in case of a buoyant condition)

EOSS just completed a very sucessful flight. I noticed they carried an American flag on their capsule. I think we should do the same.

We need to select a frequency for the simplex repeater and get the word out. I'll notify the balloon scheduling email list on egroups about our upcoming flight as soon as we do the following....

Select a date (it sounds like 17 Nov will be the one)
Select a repeater frequency (how does the 2m call freq sound, 146.52 - I think)?

We have a manifest for the flight.

We'll need to shoot a bunch of CC/PS boards. Does someone have a basement where we could do this?

Paul

Greetings all....

I have come upon a great deal on GPS receivers and would like to know how many would be interested in obtaining one. These are Magellan GPS 2000 XL handheld models and come with a swivel-base mounting bracket and power-data module for running on external power and includes the pin-outs for power and NMEA 0183 data. These are new units, but don't come with any warranty since I'm not the original purchaser.
Need a great source of GPS data for your APRS tracker ? I can get them for $100 and will pass them along at the same price with free shipping. There are 50 units available, so they may go quite fast (first come, first served !). If the interest isn't generated here, I will list them on E-Bay with a $100 minimum bid.

Contact me direct if interested..... n7ubo@...

Tim, N7UBO

From: BLOHM,BILL (HP-Boise,ex1)
Topic: 902 Message: 902

I've got two requests here. I'm in a class all week, so won't be seeing my e-mails except during lunch and after class sometime, but wanted to get these out.

First, where should I send/put the pictures of the parachute practice from this past Saturday (10/20/01)? I've got them on the laptop here, so can send them today once I know where to do so.

Second, going through the web site, I noticed that one of the things balloon chasers are supposed to do is log the data they're receiving. Merely for my own amusement, may I request the data from the last balloon, the one that was lost? I realize that if this data was being logged through APRS+SA or a similar program, only that data that has the checksums will be received, handled, and logged. Raw logging, however, might have caught some data that wasn't accepted by an APRS program. I've got two reasons for this request, one of which is to examine the data with a viewpoint towards seeing what a flight path might typically be like. The other is to see if perhaps I might be able to offer any aid in recovering the missing balloon. Besides, I like playing with navigational data, anyway.

Paul & the group,

I will be back in town for the parachute test this Saturday, but I am doubtful on any launch date in November. I am off the week from work, so I won't be able to get a definite answer until next Wednesday. Just give me a time for the parachute test and I can be there to take pictures or take the ride in the jeep, whatever needs to be done....!

The 17th currently looks better for me. Either is doable as far as I know.
(Kids are starting Y Basketball but I don't yet know when the games are.)

Time and location for the parachute testing figured out yet? I, too, may have my son in tow.

Who is bringing what?

I'll bring a 'chute for testing. I'll also bring a metal ring and one of
my lanyards. I'll cut a couple of dowels to pin the 'chutes to the
ring. I'll also bring gloves. Am I missing anything?

We need a stop watch and cord.

Hi Paul & Group,

As long as the MIM will transmit a string that APRS+SA and WinAPRS can display then count me in for a controller board. I like the option of being able to interface a KPC-3 also, nice backup. Remind me please how much they were so I can begin counting pennies.

++++++++++++++++++++++++++
I spoke with Tim at FAA Denver Center yesterday (Jeff Nicklos is out
a few days).

The word is that unmanned balloons are prohibited from flying thru
the new Enhanced Class B airspace surrounding some 29 CONUS airports;
DIA is one of them, but the only one in Colorado. This airspace extends
to a radius of 30 NM around the DEN VOR (about 1 mi S of the approach
end of Rwy 35L) and from the surface to, effectively, the orbit of
Pluto.
++++++++++++++++++++++++++
Does anyone have an aeronautical chart? We need to see how
this effects us.

From: Mark Conner
Topic: 917 Message: 917

Here is a link with all Class B airspace indicated:
http://www.eaa.org/flightplanner/us_maps.html

Closest ones to Boise are Seattle and SLC. Kansas City also has a
Class B area. NSBG's normal launch site is OK unless the flights go to
the NNW-NNE.

Paul,

I usually try to post to the entire list,
but until I get up to speed on what's going
on at TVNSP, and/or if the post would not
be of great enough general interest, I'll do
these direct.

[from earlier] Is a "thermochron" a temperature
data logger? Is it by any chance one of the "Hobo"
brand models?

[from today] Who does your small quantity boards
for $6? Special contact or friend?

I'd like to find a way to make a small bunch of
SkyQuest expendable boards. Speaking of that,
would like to send you a SkyQuest expendable and
maybe have you fly it sometime just for fun!

From: Harold Riley
Topic: 889 Message: 919

Just realized a second too late that it didn't
quite work as intended. :)

As long as I'm posting, might as well mention that
I also contacted Weatherwise last week and spoke
to the editor about the upcoming Super Launch
article.

Weatherwise has agreed to fax the article direct
to QST magazine which is interested in seeing the
article. I let QST managing editor Steve Ford
know about the Wxwise article, and he says QST
would like to see pictures of the launch for
consideration for "Upfront" section of QST or
elsewhere (QST web page is one alternative).

I mentioned that some of the pics I've already
seen are noteworthy and eyecatching (Mark Connor
website), and I sent
the digitized version of the "3 balloon rising"
image to Steve and Joel Kleinman, also an editor
at QST. This was just as a sample submission,
and was not intended to be used by QST in that
digitized form anyway.

I'll post back here with the QST snail mailing
address and Joel's name and title in case there
are any TVNSP listers with photos they'd like
to send. QST wants prints, slides, or *high*
quality (many pixels; sharp) digital files.

This message will go to KNSP list when I get
subscribed.

Thermochrons are made by Dallas Semi. They're a small can
containing a temperature sensor, real time clock, memory, and a
battery. They're about the size of 5 stacked dimes. You connect
htem to a PC and give them a mission. After the mission, you
connect them to a PC and download their data. Check
www.ibutton.com

> [from today] Who does your small quantity boards
> for $6? Special contact or friend?

It's me. I make them in my bathroom, when I don't need it for other
things.

Send me a schematic and I'll try designing the board. Send
TVNSP an expendable and we'll tether it to a flight. Can you email
us the frequency and format of its data?

K-State has requested information from me regarding the mini-symposium this summer. I notified them that we would not charge for the program (which I think helps our case). They do need to know the date involved.

what dates did we settle on. We want to launch around the 4th of July. People would arrive on Thuesday as i recall, with the mini on Friday. This leaves Sat and Sun as possible launch dates.

Is this as everyone remembers?

Paul-
I heard about you and TVNSP from Don Ingram. I'm a new local ham, and RC'er, fly by video (ATV), etch my own circuit boards, some Robotics and a little PBasic. I am a master micro woodworker. Literally! Anyway, I think what your doing locally would be great fun to get in on. Do you have an upcoming launch?, Parachute testing? Something I can help with and learn from? I'm volunteering to learn and build and chase and..... well you get the idea. I have an RC plane that uses a 3.2 cid gas engine. It has a 12 foot wingspan and was built just to haul stuff up in the air. I can probably get 35 to 40 pounds off the ground with it and drop it for test's. I know it won't go very high compared to what your doing, but if someone needs a flight platform for pre-launch test flights, I'm in. Just let me know where and when.

We're doing drop tests of parachutes from balloons this Saturday
at Northview Park, at the intersection of Milwauke and Northview.
Testing starts at 7:30 AM and runs until ????

We're planning a launch on the 17th of November. Now that you're
a member, you can keep up to date with our activities. Starting
next month we'll build a fleet of capsules. You're welcome to build
them also.

I knew about ibuttons, but the thermochrons are new to me.
Should have done a web search first too.

I'll have to get at least one of these quick. Paul,
have there been delays in delivery lately from the Dallas
online store?

Paul V.> Send me a schematic and I'll try designing the board. Send
PV> TVNSP an expendable and we'll tether it to a flight. Can you email

PV> us the frequency and format of its data?

Hitching a ride with TVNSP would be great fun and an honor.

I can modify the format and channels as needed by a particular
mission, but the format we've used has been flight tested and
is already published on the SkyQuest website:

http://www.geocities.com/n1ltv/sqpage.htm

Please note that additional SkyQuest material is linked
from the above page. Take the link to HABLIC and then
link again to SkyQuest NWS Open House 2000. This could be
organized a little better, but that's the way it's set up
now.

The telemetry is emitted on a precision clock schedule
in both CW and RTTY (ASCII). The receiver should be
an SSB capable unit. The modem hooked to the SSB receiver
audio output is a little out of the ordinary (for the last
decade), but doesn't have to be homemade.

CW and RTTY can and is decoded by computer, unattended
(almost). The "almost" qualifier is because the tuning
is way less forgiving then FM, but then the range per
milliwatt is superior (with CW and probably also with
OOK RTTY).

From: Harold Riley
Topic: 889 Message: 930

The following is directly from the web page linked as
"controller capabilities." SQ3 is SkyQuest 3 from May 2000.

Beside F, I, and O, there is a B reading (only in RTTY)
that is battery voltage. We don't use 144.00 MHz
anymore. The entire format is reprogrammable, and the
data cycle is synchronized to whole minutes. This means that
everything you might hear as far as IDs, temperatures,
etc. will be repeated exactly every 60 seconds throughout
the course of the flight. That makes it easier to discern
what's happening under marginal signal conditions, as
well as establishing an unmistakable signal signature.

Hank

SQ3 telemetry data format

Transmitter: ~144.00 Mhz

1 frame per minute

F = frame number 0 to 99 and then rollover to 0; leading zero
retained
I = inside temperature 0 to 255; leading zeroes retained
O = outside temperature 0 to 255; leading zeroes retained

CW data: F07 I234 O186 1 data set per frame
RTTY data: I=234 O=186 B=076 2 data sets per frame

CW at approximately 18 WPM rate.

RTTY on-off keying (see ARRL Handbook) at 110 baud ASCII, 7 bits, no
parity, 2 stop bits.

Decoding tables for temperature and battery voltage available.

Okay kids, we need to be set upwith SSB. I assume we'll want a
stationary site to handle the telemetry. I'll throw in a camera
pointed down to get pictures of Hank's capsule.

We'll need to weigh capsules. If we don't have the weight this time,
we'll put it on the next flight.

Paul,

I don't have a controller wired up at the moment Paul,
and realistically won't be able to do so with any kind of
margin of comfort for a November launch. Maybe if TVNSP
goes into December we could get you something with some
time to spare.

I was talking about something in advance and not even
presuming about a launch even this year. I am gratified
that it could even come up for consideration this soon after
the mention of it.

It weighs just a few ounces including its clock
oscillator "transmitter" AND battery. TVNSP might like to
hook up a real 2 meter or other frequency transmitter
instead of the clock, but it has been very susceptible
to RFI -- indeed so much so that the clock and a two
stage approx. 50 milliwatt transmitter have been the
only ones to not paralyze it with RF. By paralyze I
mean stop the controller cold so that it babbled
nonsense.

There's actually a pretty good picture of it on
the website, as well as the NWS field receiver
and decoder station under the big tent.

You'll see there isn't much to it. I'm not a software
guy, but this is predominantly software, although adding
a barometer/altimeter in the near future will add linear
circuit complexity that has been largely avoided with the
present voltage and temperature channels.

This list is sure hopping. :)

Depending on wind and weather, we may be able to launch in the
winter. You'll definitely want to be ready for Spring. My plan is to
tether your capsule below our experiment module. We'll get
pictures of the ground along with your capsule.

From EOSS
++++++++++++++++++++++++++++++++++++
Hi Paul,

EOSS doesn't have any flights on the docket for November, so there
are no freqs to coordinate. But we'd sure love to help ya hit a
record repeater QSO from here in the Denver area. The driveable
high summits are closed for the winter, but maybe some of our members
on the western slope could get in. Have you run a range circle from
your expected apogee yet? And what freq will your repeater use?
++++++++++++++++++++++++++++++++++++

At the next meeting, let's pin down our frequencies.

The next meeting is next Sunday, at Idaho Pizza. Same time and
same place.

Note this meeting is on Sunday, rather than Sunday.

We need discuss the next mission and introduce new members to
TVNSP.

Paul

I just checked with HobbyTown in Boise. We can use their gaming room in the back. It's set aside for any groups doing hobby type activites.

We have to wirte in the times we'd like to use the room. If our meetings aren't closed to the public, then the room is free. On their calendar, Saturdays are already taken. However Sundays are fully opened. Would people be interested in meeting every other Sunday to work on their near space capsules? HobbyTown is opened from 11:00 to 5:00 on Sundays.

Any interest in TVNSP sweat shirts? I'd like to make the back logo "Got Helium?"

I'll start putting together a set of flyers to advertise TVNSP and our HobbyTown meetings. I'd like to drum up some more public interest.

For the Nov 17 flight, some one mentioned that we should contact a particular TV reporter. I believe he works at Channel 7. I can make the contact if you'll let me know who it is.

We had a great balloon test today. It took more hours than we thought, but was very entertaining (and people say quality entertainment is difficult to come by these days). We'll be putting video of a certain person taking hits off the helium balloon.

It is a model CCD-TRV68 Sony Video Camcorder. It records 2 hrs on standard play and 4 hrs on long play when using a 120 minute cassette. It uses 8mm tapes (standard or Hi8). It weighs just under 3 lbs with tape and battery installed. It comes with a 2 hr lithium battery. I bought and installed a 5 hr battery.
It has been flown on two flights. The first flight was a night flight that took it to about 85,000 ft. On that flight the small B&W viewfinder failed. A circuit board that supply's power to the viewfinder was replaced. Everything else was fine and we had good video. The second flight went to about 44,000 ft. There were no failures. Our next flight will be on Nov. 17th and we hope to reach 95,000 ft. I'll report on camera performance after that flight.
There is a couple of things to be aware of with this camera. Once the camera is powered on you must start recording within 5 minutes or it will shut off automatically. We start recording as soon as it is turned on. The focus must be set to manual and set to infinity. The autofocus doesn't know what to focus on at altitude and keeps hunting. You get some blurry recordings.
I would be interested in hearing about how other video camcorders have been performing.

Hey all - I think I mentioned to some of you that I have a weather monitoring station on the house. Thought you would like to see the data for the time when we were chute testing.

Highest wind speed recorded was 5mph. Highest average was only 2mph. (That's the average over a 15 minute period.)

The temperature was about 40 degrees when we really got going at 10:00 and rose to 60 by 1:00.

Obviously conditions differ some in Boise (I'm in Eagle) but it should be fairly representative.

Paul-
Sunday is good for me also. How do the Camcorders get brought up to altitude? Do they just hang out in the open? I have an idea for a heat source. Its just a thought, but I have seen Chemical hand warmers for outdoor activities. It's been a few years, I've never bought one, but it seems to me they were something like a palm sized Zippo lighter. You mixed two chemicals and it just gave off heat for awhile. You put it in your pocket and whenever your hands got cold, you reach in and hold the warmer. Slow chemical reaction just may be the way to go. Epoxy puts off heat when polymerizing. But then again, I don't know if it would bust out of it's containment.
The sweatshirt souds good to me but only if I can get an Extra Large/ Long. I think the Long are hard to come by.

It will need to come to me to get put on the web. What format is it? You
can just email it to me.

952. RE: [tvnsp] Sunday OK

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-10-28 14:36:49 UTC
From: K7JPS - John
Topic: 950 Message: 952

Sunday's are a good day for me to meet and build capsules, Also Paul, would you put me down for 2 controller boards. Not that I'm going to build both of them up this winter, but I would like to have a "spare".

Dan, when you come to our meeting I'm sure that Jeff will have his capsule with him so that you can see the setup. The camcorder is contained in it's own insulated module inside the capsule, with an opening for the lens. I think he is planning to add an opening for the mic to reduce camcorder noise and pick up more external sound. In previous flights we have been able to record the sound of a train whistle and an airplane engine.

After the viewfinder failure on TV01F we were concerned that the cause may have been cold induced. We discussed the possibility of using hand warmers, but it was brought to our attention that the packs also require oxygen which the manufacturer assumes is in abundant supply for a human user, however this is not the case on balloon flights.

Subject: [tvnsp] Sunday OK

Paul-
Sunday is good for me also. How do the Camcorders get brought up to altitude? Do they just hang out in the open? I have an idea for a heat source. Its just a thought, but I have seen Chemical hand warmers for outdoor activities. It's been a few years, I've never bought one, but it seems to me they were something like a palm sized Zippo lighter. You mixed two chemicals and it just gave off heat for awhile. You put it in your pocket and whenever your hands got cold, you reach in and hold the warmer. Slow chemical reaction just may be the way to go. Epoxy puts off heat when polymerizing. But then again, I don't know if it would bust out of it's containment.
The sweatshirt souds good to me but only if I can get an Extra Large/ Long. I think the Long are hard to come by.

I added the opening for the mic. It picks up external sound ok but it
still hears internal sounds really well. Hmmm?

Actually Paul thinks it was the altitude. His theory is that the low
pressure
conditions allowed high voltage arcing. We'll find out on the next
launch. It
may have been a coincidence and was going to fail anyway.

I'm told that the hand warmers also put out moisture. Not desireable. I
believe
a well insulated capsule is the trick.

A remote mike should fix the problem. Good quality electret microphone
elements with 30-15,000Hz response are available from RS 270-092 for 2.99.
It requires 4-10 volts and would be easy to make.

We fit them into the capsule airframe. They stay reasonbly warm
when compared to outside temps of -60 F.

We've tried heaters before, in fact I think Mark Conner used a
thermochron to test one.

It seems they don't work well at high altitudes. I think we need to
use electric heaters or/and blow warm air into the capsule before
launch. Do we have an politicians in our launch crew?

Jeff, does your camcorder have a jack for external mic? I suppose
we'd have to surround the mic in foam rubber to cut the wind
whistle as the capsule makes its plunge from 100,000 feet.

958. (Fwd) Great Flight today!

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-10-28 20:42:07 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 958 Message: 958
Attachments: 2 described; binary payloads are missing from this source WARC

This email was sent to me from Dr. Murray and the Bozeman Gang. You'll love the high altitude photo I'm attaching. So are we going to let them get away with this? I mean, they made 110,000 feet!!

Dr Murray, isn't this your third flight?

Enjoy
Paul
****
As most of you know, we had a wonderful flight today. It's great having skies clear enough to actually watch the balloon burst with the naked eye at 110,000 feet! The payload landed within sight of a road again, around 85 miles from Big Timber just the other side of Billings. We recovered it near Huntley (about 6 miles east of the I-90/I-94 interchange).

Our last full APRS packet was 109,940 feet, but the balloon continued for several more seconds at 1000 ft/min before we saw the burst, so I think it's safe to assume we broke the 110,000-foot mark. Awesome!

I wish I could say the same for our digital pictures. The camera somehow ended up with a slight tilt upward, and so many of the photos show little or no landscape. But we did get a few to look at. The one included here is near the max altitude. I've also included a ground shot from right before launch.

I promise I'll get stuff up on the website this week! I know, there are still things from the last flight that still need to go there -- I've had a lot of other projects on the plate recently, but this next week is devoted to getting caught up with the website.

Enjoy!
Mike.

959. Breakdown voltage vs. altitude (pressure)

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-10-28 21:07:53 UTC
From: Ralph Wallio, W0RPK
Topic: 959 Message: 959
Attachments: 1 described; binary payloads are missing from this source WARC

> may have been a coincidence and was going to fail anyway.

Standard spark-gap breakdown voltage is 75KV/inch at standard temperature and pressure, 25dC and 760mm hg (aka 760 Torr). Breakdown voltage is approximately proportional with pressure and, to a much lesser degree (pun intended), inversely proportional with absolute temperature (dK). Multiplying factors for other temperatures and pressures are available in engineering handbooks such as Reference Data for Engineers: Radio, Electronics, Computer and Communications, (Sams) page 48-4.

As a high altitude balloon payload rises it encounters both lower pressures and lower temperatures. These values are from U.S. Standard Atmosphere, 1976:

20,000ft -24.6dC 349 Torr
44,000ft -56.5dC 117 Torr
60,000ft -56.5dC 54 Torr
80,000ft -51.2dC 18 Torr
100,000ft -46.1dC 8 Torr

Changes in multiplying factors for temperatures are small, on the order of 0.01/10dC, so we can ignore them. The impact of changes in pressure are much more significant and shown in the attached graphic. At 44Kft (approximate maximum altitude of the last TVNSP mission) breakdown voltage dropped from 75KV/inch to 33KV/inch. At 80Kft (approximate altitude of viewfinder failure during previous mission) breakdown voltage dropped to 10KV/inch. At 100Kft breakdown voltage would drop to roughly 5KV/inch.

Perhaps the viewfinder did not fail during the latest flight because maximum altitude (and minimum breakdown voltage) did not approach values from the previous mission.

Perhaps TVNSP could fly an experiment to test these predicted values by varying kilovoltage and detecting breakdown at various altitudes.

It might be interesting to compare pressures encountered by high altitude payloads with those associated with various grades of vacuum:

Vacuum Ranges
Rough (Low) Vacuum 759 to 1 x 10-3 torr (approx)
High Vacuum 1 x 10-3 torr to 1 x 10-8 torr (approx)
Ultra-High Vacuum Less than 1 X 10-8 torr

Paul,

What a cool rarified atmosphere picture!
Thanks for sharing that.

I'd like to get the web address for this
Bozeman project and possibly several others
that are needed for an update of the
AMSAT balloon page, as well as for HABLIC.

As for AMSAT website, there are a couple of new
groups that have launched as much as 12 months
ago that are not listed that
I already know about. Two are TVNSP and
Mark Conner. Trouble is, I can't
think of the others right off the top of my head.

So, here's the url that points to the
AMSAT balloon page for anyone to check
to see what's missing:

http://www.amsat.org/amsat/balloons/balloon.htm#other

If you find something missing, other than the
three mentioned above, please email me with the
details. We're primarily looking for groups that
have launched at least one flight in the last
24 months -- that's a loose definition of active.

Hank

Jeff,

Thanks for these. I guess I better let you all
know that there were just a few balloon sites at
AMSAT listed in a separate category (such separation
will be eliminated soon). Those are as follows:

Balloon Project of AATiS (Germany) - in German
EOSS - Edge Of Space Sciences
HABET - High Altitude Balloon Experiments in Technology
SimSat - Simulated Satellite

So we do have HABET and EOSS already. As for Ralph's site,
I don'think he's launched an amateur balloon lately, but
in any case he'll be listed somewhere as a resource.

TVNSP listings do get quick results! :)

I have posted two video clips showing TVNSP 01G's landing. You can see the parachute shadow just before impact.

Maybe "touchdown" is the preferred term here. My video earlier this year, on the other hand, makes proper use of the term "impact".

14.5 Mb MPEG:

968. Prepare to be humbled

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-10-29 13:35:56 UTC
From: Ralph Wallio, W0RPK
Topic: 968 Message: 968

To those of us who dream of high altitude balloon borne payloads and missions then design, engineer, fabricate, fly, recover and tell the story in our web pages, prepare to be humbled. Turn off your soldering irons, save your work space, set aside your mystery then read every word and study every graphic at http://members.shaw.ca/sonde/index.htm.

Mark, I can only view the file. When I click on it, I'm not given the option to save it. Can you email the file to me?

Technically, I'd say we still have not recorded an entire flight, since we didn't get over 75,000 feet. With any luck, we'll do that 17 Nov.

Paul

971. Awww, not this heat thing again.

Topic: 971 Message: 971

I never thought about the oxygen requirements for the handwarmer. And I guess when you get right down to it, Mixing up a baggy of Epoxy to shove in a capsule for heat prior to launch just doesn't really sound to appealing. Thanks for keeping the new Guy straight on those issues guys. OK, How about Reversible Electromagnetic Thermodynamics? Have any of you tried to see if a Peltier Junction would work? I'm sure it would work effectively at least part way up, and again as it started getting back into the denser air on the way down. It is dependant on heat in the Ambient surroundings. I saved this one for last because it needs a power source and will be a little heavier.It would also have to be built in a capsule wall or floor.

If you right-click on it, you may get the option to "save target as...", depending on your mail program.

Otherwise, you can go to http://www.n9xtn.101main.com with your browser and do a "save as" that way. This morning I took out the main HTML pages I was testing with so you should see a list of files to download.

This server is actually on one of my home computers, which I've configured to serve up these big movie clips since my ISP has only 10 Mb of space for web pages.

973. Dallas Thermochron group buy -- interested?

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-10-29 16:40:34 UTC
From: Hank Riley
Topic: 889 Message: 973

I think I've found thermochrons *in stock* at
a distributor. I'll know more by this afternoon
eastern time.

Would like to get one or two for myself, plus a few
more to enhance the economics.

I could accept payment by Paypal via your credit card
until I think Nov. 3, at which time the Paypal policy
changes for people (payees) who have the lowest form of
Paypal account, which is what I have presently.

Items of interest are

D51921L-F51 Thermochron button

Blue Dot receptor

Your price depends on how many orders we collect, but
will be comparable to ibutton online pricing, and actually
a little lower. Looking for at least four themochrons
to make this quick buy feasible; more is even better.

I'm moving fast on this because I'd like to have some by
THIS Saturday for a weather club meeting! If this works,
you can have your thermochrons delivered by first class
mail around a week from this Saturday (Nov. 10).

If you want, email me direct, or post to the list as you see
fit, especially if there are questions. If there is
interest, this purchase will be repeated later.

Thank you for being such an active and enthusiastic bunch of
people.

Hank

> -20C and the other at -40C.

Even though the ibutton website lists the lower
temp one as well as the first one produced,
the person I spoke to last week at ibutton says
the lower one is not in production (shucks), and
there is a delay in even getting the upper one of
"4 to 6 weeks." You folks have already experienced
that.

I hope she knew what she was talking about.
She shared with me a bit of the inside story
on what's going on as far as thermochron
fabrication and delivery expectations.

She contends the lower temp. unit won't be
around until 2002 at the earliest. I guess
it's been a difficult goal to achieve.

I'll put the group buy request on KNSP in
a minute.

I need to replace four shroud lines on the parachute before we can launch. Unfortunately, I'm out of 150 lb test spectra. Jeff, is you kite string 150 lb? If so, can I use about 50 feet of it?

There's a meeting this Sunday at Idaho Pizza. Bring your balloon stuff for a show and tell (isn't that what teachers are good at?). We'll get the new crews up to speed before cracking the whip at the next launch. What time do you want to hold the meeting? How about 5:00PM?

The first winter meeting will be held in November. Is anyone interested in making the next meeting (4 Nov) the first winter meeting? If so, I'd like to hold the meetings every 1st and 3rd Sunday of the month.

We're allowed to bring food to HobbyTown, as long as we clean up after ourselves. So do we want to hold this Sunday's meeting at HobbyTown, instead?

One thing I'd like to test is the breaking strength of foam with and without plywood.

Mike, can you email me the helium video you took?

The parachute tests were so sucessful and fun, that I'd like to do them again. This though, I'd like to carry telemetry capsules. The GPS data will give more accurate results. I prelimenary look over does not show a linear relationship. But it may not be far off. I could use more data.

There may be a lot going on within Dallas and its new
owner, Maxim. However, the story given to me was that
production was being/has been moved to the Phillipines.

This may be just thermochrons or it could be
everything from Dallas -- I don't know.

To continue, the story is that the low temp unit will not
be manufactured until several months into 2002, and that
sounded like it might be a dream (there could have been several
missed deadlines already).

Also, sales of thermochrons at online ibutton website are
delayed "4 to 6 weeks." That may be optimistic, i.e., it
may be more like 8 to 12 weeks (n1ltv opinion). She said
"we're not getting product as fast as we'd like."

Now, it turns out the distributor is expecting product this
week from Dallas, but again the distributor spokeswoman (lady #2)
says "who knows what will happen with Dallas?"

So it seems like Dallas may have a reputation for vaporware.

Paul, would you like at least one from the group buy if I
can confirm delivery later this week? Might be a good idea.

Welcome to the world of semiconductor purchasing, especially
in quantities under 100,000 units per year. :)

Dan,

If your referring to the TVO1F video I gave you the swing and spin is very low compared with other flights. Especially when compared with groups who use a single longer line between capsules. We use four lines that are about 12 to 18 inches long. The line between the parachute and the balloon is close to 30 ft long. I tend to think of it like a pendulum. A shorter line would swing faster. Has anyone else tried different lengths?

I had a shorter load line (about 10-15 ft) from balloon to top of parachute
for one of my flights. It fouled in the parachute's shroud lines. The
longer ones tend to stay out of the way.

The lanyards have to reach the balloon neck and back down again.
We also have to allow for lanyard handlers not being right beneath
the balloon.

Okay, we need to explain the lines in a stack.
There's a load line between the balloon and 'chute. That needs to
be long enough to prevent the burst balloon from fouling the 'chute.
There's four link lines connecting the capsules. Those need to be
long enough to keep the capsules from slapping each other on
descent. Finally there's lanyards used to raise the stack.

Paul

> I had a shorter load line (about 10-15 ft) from balloon to top of parachute

No - we're headlined at the top of the cover, but no balloon picture on the cover. Total article length is 10 pages, which out of 66 for the issue is pretty good.

It's been quite a few years since I played with the peltier junctions, but from my experience, I don't think they'd be very practical for high-altitude balloons.

Keep in mind that my experience was several years back, but I doubt they've changed that much:
1. They only develop about 10 degree C across the two sides. For an OAT of -50, that would make an inside air temp of -40.
2. They take a lot of power. Mine took about 12VDC and drew better than 1 amp of current. That'd take a big battery to power one unit.

Just some thoughts....

From: paulson58@juno.com
Topic: 1002 Message: 1002

Zack-
Hey thanks for the interest there. Yunno, the peltier junctions of today will difference the heat from one side to the other by 45 to 50 degrees. They still are pretty power hungry. I guess what I'm looking at is maybe keeping the capsule from hitting extremes when your experiment may call for more warmth. I realize it's not usually needed. I have no interest in send Mammals aloft(at least none I'd admit to). But figured between good insulation, and maybe enough power just for a couple of warmth shots at the right time you could keep something a little warmer if and when you need it.

I'm thinking about shooting warm air into the capsule before launch. Anything requiring extra warm could be wrapped further in insulation. If need be, we could wrap the most sensitive devices in an electric blanket.

Electronics Goldmine has several heating elements originally made for NASA. They're resistive-type elements, but thin and flexible. I may get one on my next order to see how much heat they put out and how much current they draw.

They do better than that now, but since it's easy to generate heat with
resistance it would seem a better way to go.

I'm working on a flyer to be put up around town as we work on
capsules. Please review the text and make any suggestions. The
top of the flyer will have a color photo of the horizon at 83,000 feet.
I'd like to put copies up at hobby shops, Scientific Wizardry, and
the Discovery Center.

Paul
++++++++++++++++++++++++++
Treasure Valley Near Space Program
(TVNSP)

Interested in exploring a space-like environment? Can't afford
$10,000 a pound to launch your own satellite or to wait for years for
its launch? If this applies to you and you have an interest in
science, mathematics, and engineering, then consider being a part
of Team TVNSP.

Several times a year TVNSP launches high altitude weather
balloons carrying functional models of satellites. These "near
space capsules" perform programmed operations in an environment
much closer to space than to that of the surface of the earth.
Flights to altitudes above 80,000 feet cost $10 a pound of payload
weight and missions reaching altitudes in excess of 100,000 feet
are possible. After recovery capsules are quickly and easily
reconfigured for their next mission. Best of all, missions typically
finish in less than half a day.

Near Space Sciences Near Space Engineering
Meteorology GPS Navigation
Cosmic Rays Microcontrollers
Remote Sensing Thermal Controls
Astronomy Telemetry
Biology Recovery Systems

Team TVNSP meets every other Sunday (twice a month) at the
Boise HobbyTown, located at the corner of Cole and Ustick. Visit
with Team TVNSP and learn how to become involved with near
space launches, tracking, experiments, or even building your own
near space capsule. There are no fees to be a part of Team
TVNSP, only an interest in amateur near space exploration.

Information is available at the TVNSP website: www.the-
one.com/tvnsp

I wonder if it might not be worthwhile also contacting schools and offering their science teachers a poster or two? At the risk of dating myself, when I was in high school, there were science and astronomy clubs, among others. These could be excellent sources of sla... uh, um ... chea... eh, er, yeah... enthusiastic labor and help.

As to the poster itself, I think it looks good. I wonder if some mention of photographic or video, even remote video monitoring, opportunities might also be worth including?

Clicking on the link "Pauls Helium Trip" results in a "file not found" error message. You might want to fix that by putting in "%20" in the link instead of the spaces (without the " of course). However, I can get to it if I cut the URL to ~tvnsp/images and select from the list then provided.

I mentioned an idea to Jeff. We should mount the servo to a boom
mounted in front of the camcorder. Every so often (say 10,000
feet), you run the servos. The camcorder will verify that they work.

I'd like to run a test with a tethered balloon this autumn/winter.
Just the same way we did the parachute test. By the way, I won't
to run another parachute test. That was a lot of fun.

It looks like we'll have to change the name of the helium file. I
suppose we can call it helium.mpg. I need to update the
webpages again. Doug, when would be a good time for you?

Paul

Paul-
Sounds good to me. I can put together a boom. I just need some Specs on how to make the mount so it's compatible. I guess we should perform a little trial work to see if I can get the servo along the edge of the viewfinder. I'll likely have to test a little more often than 10,000 feet. The manufacturer of the Radio says they come stock with 100mw power and should be good for a mile. Didn't someone say they had a 6 meter mobile antenna? Does anyone have a 6 meter mobile directional antenna. That's where I hope to pick up considerable range. I can check your guys capsules this Sunday at the meeting. Was it decided on for 2 pm?

Jeff, let's plan on working with the camcorder this Sunday. Who had the 6m beam? We need to arrange to get Dan info on balloon altitude during this flight. I can program a message into the capsule to remind us when to run the test. Dan, at what altitudes do you want to run the test? Also, do you want to be stationary or mobile?

So many questions, I wish I had that many answers.

Paul

> Paul

I'm not sure at what altitudes. Being this is a first launch for me, I'll be looking to you experienced folks for some advice. It will also depend on the type of Transmit antenna I end up with. What is the typical rate of ascent on a typical mission? I may just sit on the ground and work a Gimbal for 10 to 15 minutes. The mile they rate them at has more to do with keeping things in visual range I believe. RC fields are required by their governing body, The "Accademy of Model Aeronautics", to be at least three miles apart to prevent from "hitting" someone elses aircraft if your operating on the same channel. They have a frequency coordination plan and have used spectrum Analyzers to make sure of safety. However, the 50 MHz equipment that Hams can buy can put out up to 1 watt. This is 10 times the standard 72MHz that most modellers use. Every time I talk to a different Manufacturer staff member, I get a different story. Some have told me they come stock with higher power levels. Some have told me I'm not allowed to transmitt 1 watt because the FCC regulates this equipment to lower levels. (6 meter is OK up to 1 watt. CFR 97.125 (c)). Hence, I have no clue. The only facts will be known after the launch.
I think it would be best for me to be stationary. That's the typical means of use we plan on. My big concern for testing is to make sure we can get a couple of real solid miles of control for launch testing of the glider for descent tests. How about that meeting time this Sunday. Did that get nailed down yet? Thank you Paul

1020. Re: [tvnsp] Re: Thanks

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-01 08:32:35 UTC
From: Jeff melanson
Topic: 1015 Message: 1020

Paul and Dan,

Time out for just a minute, lets think this through. 1) My capsule is at maximum weight already (slightly over). 2) This will be the first full length video from launch to landing in near space. We already have one experiment going in front (side) of the lens. We might not want to block the view to much. 3) Dan, since this is your first launch and the last one of the season I would like to see you do launch and chase so you can see what it's all about.
Here's what I recommend. Paul, your controller can monitor a single output from the receiver. It would be one of the servo channels which is just a series of pulses. It can report the gain or loss of a signal and at what altitude it occurred. Since the signal is always present when in range no one would have to operate the sticks on the transmitter. The transmitter can be left at a designated location turned on. You would not have to worry about what altitude to wiggle a servo. With this method a servo and boom are not required, only a receiver and battery. Dan can still participate in the chase.

My flight computer (CC/PS) can count pulses. If we leave the TX
on and sending position data to the servos, the TX could be carried
by a chase vehicle. The CC/PS can be programmed to count
pusles once every data rep and reply if it found any.

1024. Sunday meeting/NHABG

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-01 15:06:57 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 1024 Message: 1024

We're meeting Sunday at HobbyTown at 2:00 PM. Bring your stuff
for a show and tell as we'll have civilians. At that meeting I'd like to
work out a "lesson plan" of what we'll talk about/build and when.

In Washington is a balloon group (NHABG) that meets on Sunday
evenings. I'd like to see if we can arrange a mini-symposium for
early next year were we could all get together. Any ideas?

Paul

1025. Great

Yahoo group: tvnsp (2000 — 2002)

From: paulson58@juno.com
Topic: 1025 Message: 1025

Jeff-
Great idea. It seems like we started out with this at JB's on the Balloon launch day but discarded it for some reason. I agree with the thinking here. It will no doubt be lighter, easier, and take less time to set up. All that would be needed from the capsule is a small hole to extend the Receiver antenna from. Maybe a plastic tube can be rigged so the antenna (28AWG) wire can be held horizontal to the earth surface. This will replicate actual use. I'm thinking I will need to supply a pigtailed connector from the receiver to your processor Paul. I think you would just need to have the pulse line to monitor, and a battery return to tie to your processor equipment ground. Let me know if you think of anything else. Also, how long the pigtail needs to be.
Your also certainly right about the chase Jeff. I want to see how the tracking works and be a part of all that from the beginning of the launch. Thank you for making it easy for me.
Dan KD7OST

1026. Great

From: paulson58@juno.com
Topic: 1025 Message: 1026

Hey you guys-
As I think through what I want to know, I realize that when I get set up I can determine what I need to from the ground. I'm being a little eager to get on your last flight of the season, and maybe too eager. If both you guys have your cargo weight at max, my work shouldn't go now. Unless you really want to see for your own reasons how the 6 Meter RC set up is, I should bow out. I can be freed up to help with the launch and chase. Your call here.
Dan

There's lots of openings in my capsule.

I use crimped 0.25 inch headers spaced .1 inches, center to
center. I'll bring my tools to make the connector.

We'll measure the length of connecting wire needed when I bring in
the capsule for a fitting.

Dan,

Bring your stuff in on Sunday. This experiment sounds interesting and
if Pauls capsule has room we should go for it. We stand the chance of
learning something while we interface the reciever and controller and
write software for it.
Food for thought: If we take the transmitter on the road with us we
might not get a chance to see when the signal is lost. If the
transmitter is stationary as the balloon moves away from it we can
calculate the range when signal is lost.
Paul, bring your scale please. Does someone have some calibrated
weights? I know my scale is wrong. It reads on the high side. The more
the weight the more the error. I should be able to figure a correction
value for it. Does the weight on a can of food include the can?

I'll bring a scale. I would imagine the weight of the can is
insignificant to the food inside.

1032. Weight for calibration

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-01 17:51:54 UTC
From: Mark Conner
Topic: 1032 Message: 1032

A relatively easy standard to work with is one gallon of water, which is 8.33 lbs. Using a plastic milk jug would probably work best, as the plastic's weight is definitely insignificant compared to the water's weight. Plus it's in the weight range where you need the accuracy.

Good point, Doug! Hadn't thought about that. I use Netscape Communicator 4.7 by default., should have tried it with IE 5.5 as well.

Case shouldn't matter, but the spaces defintely would. By not mattering, I mean that if I type in PaulsHelium, it should find PaulsHelium or paulshelium without trouble, unless it's on a UNIX type (Linux falls in this category, of course) in which case file names are case sensitive.

Dan implies another point that pushes for keeping the transmitter stationary, I think. I'm not sure of the fligh path of the balloons, not having participated in a launch or chase yet, but it seems to me one of the reasons for the RC recovery vehicle is to be able to return to a known site. Keeping the transmitter stationary would provide information on two things: range and whether for recovery we will need to have the transmitter mobile. If the stationary transmitter is heard until balloon burst or whatever causes the capsule to be released, then that implies that we would have the ability to fly the RC back to launch site.

Bill and other interested parties.
This is a work in progress that a lot of us have thought about at various times, and in various pieces. Seems that it takes quite a few elements to make it work. I'm not so sure we are interested in Guiding the Aircraft all the way from Near Space. The recent success by the Canadian team, coupled with what seems to be [at long last] of the correct blend of people, has inspired us to get it moving forward. Anyway, the idea we are beginning to discuss, is to combine elements of the Northern success with our own plans. The idea is, as the Balloon bursts, the aircraft uses GPS and an onboard computer to "Come back" to launch point. The success of this will be largely dependant on the speed of jetstream, altitude achieved and how well the airframe will cope with these elements. Unknowns for now. But, that as the Vehicle gets closer, and you can either see it, or can recognize your terrain by viewing a downlinked signal, You simply turn on a RC transmitter. This signal coming on is sensed on board and gives you, the pilot, full control to land it at your feet.
The interest now is to see just how far out you can have reliable control with a standard 6 meter RC rig. We are going to be prototyping airframes and electronics packages. We will be launching these from atop a RC "Tug" aircraft that will carry up to 40 pounds aloft. This may be a project that goes on for quite awhile. On the other hand, with enough gray matter in action out there, maybe we can have a test vehicle ready by late next year.

1049. PCB's

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-03 15:48:23 UTC
From: paulson58@juno.com
Topic: 1049 Message: 1049

Paul-
Have you tried your photo technique on PCB's that use SMC's?
I've never etched anything that small by hand but would like to
try some smaller packages for future use.
Dan

1050. RE: [tvnsp] Weatherwise arrived in mail today

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-03 16:35:08 UTC
From: K7JPS - John
Topic: 990 Message: 1050

Just received my copy today (Friday.) Kimbra did an great job describing the whole ballooning experience. I think that her article would be a good read for science teachers to help get students interested in these events and science in general. In addition it gives me a better way of explaining the hobby to my friends and co-workers about why I am so excited about chasing balloons - without getting too technical.

I also thought she did an excellent job nailing down a description of Paul on launch day.

No - we're headlined at the top of the cover, but no balloon picture on the cover. Total article length is 10 pages, which out of 66 for the issue is pretty good.

Nice Job Kimbra!!!

1061. Weatherwise arrived in mail today

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-04 16:59:15 UTC
From: Hank Riley
Topic: 990 Message: 1061

My copy of Weatherwise arrived Saturday morning, about
50 minutes before I left for a seminar featuring a
NOAA River Forecast Center hydrologist speaking about
snow surveying from an airplane (using natural background
gamma radiation -- very slick).

His office is in the same building as the National
Weather Service Forecast Office, and in fact is part
of NWS where SkyQuest has launched hamradiosondes
before, so I gave him my copy before I had a chance
to read it. What I did glance at was very impressive
and I feel that Kimbra did a real nice job, but haven't
read the text yet except for the first few sentences.

Two people at the meeting had regular subscriptions
and one brought his copy of the Nov/Dec issue which
had arrived minutes before at his PO Box.

Will check later today to see if it's at the magazine
store (Barnes and Noble). It wasn't Thursday.

QST should have already received its FAX copy midweek, but
that's unconfirmed.

Hank

Paul-
The term I was looking for last night was SMM.
This is Silicon Micro Machining. They make the meachanical or analog operations right into the chip during manufacturing. Check out
http://www.futabarc.com/radioaccys/futm0807.html
I know it;s just food for thought at this point but,
the Piezo Gyro's are less expensive, but have poor stability in cold. I can't find the Spec's on them right now. The Motorized units are rated down to 14 degrees. But, they are quite a jump in price. It would be cheaper over all to develop a small heat source and contain it, and the gyro, in a smaller interior unit.

Last night John told me that he and his family saw the aurora.
after I got home and did the dishes, I went out with camera at 9:00
PM. Talk about wow!

There was a broad semicircle of green with an arc of red over 3/4 of
the green. Two brighter pillars appeared on the left with occasional
jets.

There was a CME from the sun on sunday and the auroras may
continue tonight. After dark (8:00 PM?)tonight, check to the north.

I'll get my photos developed this afternoon.

1070. Re: [tvnsp] Antenna Info

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-07 15:02:59 UTC
From: Ralph Wallio, W0RPK
Topic: 1068 Message: 1070

Dan,

Antenna gain is measured in dBi (isotropic reference) or dBd (dipole reference). The isotropic reference is a magic antenna that radiates equally in all directions, e.g., when placed at the center of an imaginary sphere, it equally "illuminates" the entire surface of the sphere. Therefore a magic isotropic antenna has no gain.

If we could design and fabricate a magic antenna that evenly illuminated exactly 1/2 of the surrounding sphere, it would have gain of 3dBi. For 1/4 of the sphere, 6dBi gain. For 1/8th of the sphere, 9dBi gain, etc. adnauseam.

The dipole reference is for a real half-wave dipole in free space (with no ground reflections) with a gain of roughly 2dBi. The classic dipole in free space pattern has a shape like a donut with maximum 2dBi gain perpendicular to the dipole and 100dB nulls off both ends.

Maximum transmit power rating of an antenna is a function of conductor diameters and spacings for purposes of power dissipation and avoiding high voltage arc over. Power rating has nothing to do with gain, e.g., dipoles and long Yagis of widely varying gains could all be designed to have equal maximum power ratings.

A given antenna has the same transmit and receive gain but it is applied in different ways. Transmit power output (in Watts) is attenuated by the feedline (coax) before antenna gain is applied. As an example, 10W output - 3dB feedline loss + 6dBi antenna gain = 5W @ 6dBi = 20W EIRP (effective isotropic radiated power).

For receiving purposes we are concerned about signal-to-noise ratio (SNR - aka Eb/No) for the entire receiving chain. If everything else in the chain is held exactly the same, gain difference between two antennas will result in a similar difference in SNR. A more complete understanding requires a calculative process that takes all aspects of a receiving chain into account. Perhaps you would be interested in my discussion of this process which can be found at http://users.crosspaths.net/~wallio/LINKbudg.html .

You may want to consider the impact of decreasing antenna beamwidth resulting from higher gain. Narrowing beamwidth (between 3dB points - where gain is halved) requires more precise aiming and therefore, for a moving target, more frequent changes in antenna position. You might want to consider using a low noise preamplifier placed at the antenna rather than a higher gain antenna to reduce aiming difficulties.

Yes, the exact same gain will be in effect for receiving as well
as for transmitting. This is called the principle of reciprocity.

Hank

I measured the pattern last night of the parachute. It measures slightly more than one yard across and two yards long. 16 yards of fabric will be enough, but you can rotate the pattern after you cut each gore and save a lot of fabric (the gores are triangular shaped). So it may take about 12 yards of fabric. I used ripstop nylon and purchased it at Jo-Anns.

The the straps over the top and for the shroud lines, I used twill tape. It's also available at Jo-Anns.

My aurora photos came out light, but I did get one that when darkened shows something. I'll scan and post it.

Finally, I got three copies of Weatherwise in the mail. Nice article, the pictures are little different in the magazine than they are on the webpage.

1075. Seeing Auroras

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-07 22:25:23 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 1075 Message: 1075

Here's some info I'm putting together on seeing the aurora. I'm getting it from the spaceweather and NOAA's SEC websites.

Boise is at a magnetic lattitude of 50 deg north. One measure of distrubance of earth's magnetic field is the K-index. With a K index (Kp) of 9, the southern boundary of aurora reaches 50 deg north. However, the aurora occur at high altitudes (thermo or mesosphere - I don't recall which). So the aurora can often be seen when they are 5 degrees further north. Monday's aurora occured when the Kp was 8.

At the website, http://www.sec.noaa.gov/rt_plots/kp_3d.html you can get the latest and predicted Kp values. Check the site during the day and you can predict if you want to go aurora watching tonight.

Pick a location with dark skies to the north. If you want to photograph them, use fast film, ASA 400 or better, and use the bulb setting of your camera. I exposed images for 15 to 60 seconds on slow film and got some images. I needed faster film and a darker location.

We need to launch a balloon during one of these geomagnetic storms. The increased radiation at high altitudes can be equivilent to 100 chest x-rays for passengers in airplanes (I assume this is for a flight overseas).

So who can be ready to alunch a balloon at midnight, during a weekday, at 30 minutes notice? Who can chase all night during a work day?
:)

On the next flight we're carrying a geiger counter. We'll need to add to our list to check the K index during the launch.

Things are better for you folks in the midwest. The earth's magnetic field reaches lower lattitudes.

Paul

Paul,

I can launch on Sunday, Monday or Tuesday nights, those are my days(read nights) off......I am game! The only disadvantage I have is I don't have any tracking capabilities!.....hmmmm, I need to fix that!

Mike KC7DPD

1077. Odds and Ends

Yahoo group: tvnsp (2000 — 2002)

From: verhap@occ1.sd01.k12.id.us
Topic: 1077 Message: 1077

I'll start shooting CC/PS PCBs this weekend. So far I have nine requests for the boards.

Other items for parachutes are swivels (get the largest you can - 0/1), snap rings (the kind of rings used for key rings) 25mm in diameter, and spectra (kite line). For the spectra, order a roll from Into The Wind. I use 150 pound test. I ordered 500 feet of this stuff, but an now running out. A 150 foot roll is sufficient. If anyone is interested, we could collectively order larger rolls and would probably save money. Into The Wind is on the web.

I'll put TVNSP flyers out at the Discovery Center and the remaining hobby shop. The flyers are now located at Scientific Wizardry, all three major hobby shops, and DCI. Any other locations you can think of?

The Flight Termination Unit (FTU) is completed, except I need to find a better way to connect it's link line to the parachute. We need to add it to the checklist. It has a fresh battery. I suppose we ought to set it for 2.5 hours.

I think we have enough remaining weight that we can send up two t-shirts, one in each capsule. I'd like to include a copy of Weatherwise. I'd like to have the launch crew sign it, then we'll get a picture before we load it into the capsule. After recovery I'd like to get additional pictures. After the photos are developed, I want to send the magazine to Weatherwise as a thank you.

I'll post the flight on the balloon schedule list today. Can we get "QSL" cards in time for the flight? I'd like to send one to everyone making contact witht he repeater on this flight. I'd like to load the cards into the capsule.

I'll make the dropzond's parachute today. I plan to use a cross parachute.

Paul

1078. Hypotethical Aurora Flight

I've giving it some thought. If we launch for an aurora, what should we send up? Here's what I've come up with....

Geiger counter - to measure radiation from the CME
Camcorder with image intensifier - to record the aurora from 100,000 ft
Color wheel - to create color images of the aurora
VLF Radio and tape recorder - to record spherics

Any other ideas?

Paul

1079. Re: [tvnsp] Hypotethical Aurora Flight

GPS Unit for tracking - probably one in each capsule
and a radio beacon. It was the beacon that saved us on
the last night launch.

I would be interested in doing this, but I don't have
the tracking equipment at the present time.

Mark brought up a good point. When we send up capsules, there's always that slow rotation. It's possbile that it comes from the twisted load line from unwinding. The spectra kite line and other nylon lines are woven, rather than twisted. i'll see if I can pick up some woven line at the hardware store for the next launch. If not, Jeff, can you spare 30 feet of your spectra?

After the flight we need to compare the video to previous flights.

Be careful with spectra. Friction will melt the line.

FYI-
The following link to Pratt Hobbies will get you to Kevlar line.
I don't know about the weave of this Kevlar. Pratt is a Model Rocket Company. The Kevlar is not coated so can be tied and glued.
It is Very, Very, heat resistant and strong. It will not melt. They sell it in 100lb test for .10 a foot, 250lb for .15 a foot and 500lb for .20 a foot. It is listed as SL1-C, SL2-C and SL3-C respectively. Maybe they have it woven.

If it wasn't enough to launch on Saturday and have a TVNSP meeting on Sunday, there's a meteor shower Saturday night. The Leonids are most active in 33 year intervals. This year's shower could be major, really major. I plan to watch it from Bogus Basin (or there abouts), that way I'm above the clouds and lights of the valley.

Is anyone interested in seeing the meteor shower? If you have a camera with a bulb setting (and a cable release) you can photograph the shower.

The predicted maximium for North America is at 3:00 AM Sunday morning.

If friction is actually a problem, how about Spider Wire from fishing gear? It's extremely strong, I think, but am not positive, that it easily goes to the desired strength. The only real issue would be any knots. Care must be used in tying them as Spider Wire is slippery stuff. It is, however, virtually unbreakable.

Just a thought.

the drive is all paved except for the last seven miles or so, with the last couple being fairly steep and rough getting to the top. If you don't want to go clear to the top, there's a large flat area just before the last climb that would still be good for observation....you know you're there when you come upon an FAA snow-cat shed.

I was thinking about this stuff too Bill. Might be worth experimenting
with. I have some extra line left over after trying it once. Will donate
it when i can make a meeting.

I hate the stuff for fishing. You cannot cut it with nail clippers. Even
a knife
has a tuff time for close/neat cutting of tag ends. The best way to cut
it is with scissors (not your wifes favorite pair) and then throw them
away. You can turn boulders over the size of a car if you get hung up on
the bottom of a river. The hook will usually break before the line
snaps. It has a nasty tendency to spiral into the most beautifil
crochet'd knots (i think they were knots) if you do not have a good
swivel at the terminal end of the line. I have seen new knots that no
sailor has ever dream't of tying. The slippery feeling of the line is
nice until you find out it has cut to the bone of you fingers while
trying to retrieve you favorite lure. For Whaling it might be ok in my
book. Back to good old monofilament or dacron for me.

Maybe it was meant for ballooning <;)

Mark Conner,

We are preparing for a launch this weekend and the weather is getting cold. I was wondering about how much temperature change there is at 95,000 ft. Does it get significantly colder?

We know that alkaline batteries loose power as they become colder. They regain that power as they warm up. This is why my GPS shutdown on the Twin Falls flight. Lithium batteries are not affected by cold. I'm told that NiCads are not affected by cold either. What about NiMH (Nickel Metal Hydride)? Are they affected by cold?

It may even be slightly warmer near the tropopause during the winter. Typically, the tropopause is higher and colder in the tropics than in the temperate or polar regions. However, you don't have the warm air at the low altitudes to keep the package a bit warmer on the way up. So it all may balance out.

NiCd and NiMH are affected by cold, but I don't think they are affected to the degree alkaline batteries are.

I got a suggestion a while back from a ham who does a lot of R/C work. He suggested topping off NiMH batteries at a fast-charge rate (1C or more) before launch. This will heat the batteries to about 60 degrees C and thus will take longer to cool off.

My suggestion is to insulate the batteries (or what they're contained in) to the extent possible. I surround my NiMH pack with an inch or two of styrofoam. The thermochron in with them never got very far below 0C and typically got no colder than 5-8C during a flight.

Below is a graphic I found showing capacity change with temperature of NiMH cells.

And here's where I got it - lots of stuff here about NiMH batteries.

All batteries are affected to some extent. They are, after all, a chemical reaction so will slow as the heat level decreases. That said, yes, some types are more affected than others. The batteries used in cameras are particularly susceptible.

>I got a suggestion a while back from a ham who does a lot of R/C work. He
>suggested topping off NiMH batteries at a fast-charge rate (1C or more)

Seems like a pretty valid idea. Throw in that insulation around the outside of the batteries and they should retain that heat for some time. As we discussed at the last meeting I'd say it would be well worth keeping them in a warm car till the last possible moment.

I've got a weather station on the house (not yet hooked to APRS, but someday!) so I'll pull the early morning temperatures this week. Eagle tends to run a little cooler than Boise, but last week we were getting down into the lower 20's F around sunrise.

Paul-
I made up a Connector to go from my Futaba Receiver to your Dip Header socket on your Stamp carrier board. I brought out the Ground and the pulse, and put them side by side. I also have a styrofoam weathercock to trail the wire antenna downward against the airflow. I can package the whole thing (minus antenna lead) into a foam block. I will be using NiCad AA cells, but am not expecting to see the signal higher than 3 to 5 miles. I don't think I need to pack the batteries for warmth. I would be more concerned with the Quartz Crystal Oscillator drifting freq due to cold, but have run them on the ground down to 25-30F. I'm thinking it may not be effected adversely by temperatures until long after I'm done getting a reading. (I.E. capsule temp won't drop that fast). Any thoughts you have here would be appreciated. Also, I can get this to you sometime this week. Whatever it takes to keep this from getting in the way of your own pre-launch efforts. I will make every effort to get this to you so you can write it in the stamp program and not have to mess with it on Launch eve or morning.

The Boise NWS si predicting a chance of rain on Friday and Saturday, with clear skies on Sunday. The MRF shows a low pressure trough giving us southwest winds until Saturday afternoon when they turn to the northwest.

It looks like Saturday's launch is borderline between good and bad weather. We'll know better as the weekend approaches.

The astronomy club is having a meteor shower watch at Bruneau Dunes. I'd like to head on over there Saturday after the flight. Bruneau would like us to do a launch from the State Park. The ranger I talked to thought they might even be able to pay for the launch if we did a talk that evening for the public. If we do this, we need to set up a mission control for the public.

I need Lee's email address. Does nayone have it? I'm sending him our two latest videos and a t-shirt that went up to 85,000 feet.

I'm wondering if we want to put a current limiting resistor on the
pulse side?

If your reciever doesn't hear a signal, does it still try to position the
servos? Here's what I'm thinking..... If your transmitter stays
within range, there should be pulses on the reciever. Once your
transmitter is out of range, the pulses from the receiver will stop.
By counting pulses, we can tell if the reciever is still within range.

The cutdown device is complete, including its housing. It's labelled the Flight Termination Unit (FTU). The Dropzond is complete including its parachute. I need to finish the dropper unit. The thermochrons are not here, so I made a cable for the temperature array I created last year.

I shot the first CC/PS board last night. There was a rotation between the top and bottom, but not so bad I can test the board. I need to order a second packet of double sided boards before I can finish them all. I'd like to set up the PCB lab in a basement and shoot the boards at once. Is anyone interested?

I can't think of any reason why a current limiter should go on the pulse line. The pulse comes out of a CMOS surface mount D type Flip Flop. It doesn't get amplified before it's output. It's already very, very high impedance on the output. At least 10 mega-ohms.

This sounds good to me. I have no idea of and would likely not even comprehend what you've got your BSII SX doing. Whatever works easiest for you is OK by me. I'm just along for the ride. My system will not be set to Fail safe. This means there will be no pulses going from the receiver to your Stamp after the signal is lost. I expect a few miles of rock solid signal, followed by a very short period of marginal or glitched out signal, then the receiver will lose lock altogether and be quiet. I already have a Cable made up for interface.

The PCB i use is presensitized. I've give you a copy of the article I wrote for Circuit Cellar Inc on making PCBs at home.

I'm looking for a temporary place to shoot all the boards. I'm hoping to make it a part of the TVNSP meetings. I make the boards in my bathroom, but sometimes I need that room for other, err, functions.

From: Mark Conner
Topic: 1115 Message: 1115

Hi all,

Good luck with your flight this weekend.

Is someone planning to record the repeater traffic? If someone has a radio and a scanner within range, it could help with failure analysis, plus it's nice to have a complete record of the traffic. Beats trying to write callsigns while driving.

Here's what I use:

1118. Prediction, Nov 12

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-13 02:46:04 UTC
From: John Knapp
Topic: 1106 Message: 1118

Paul, I apologize for the confusion this morning. I miss read your email about doing a night launch.

Anyway, my predictions for tonight:

If launched from Succor Creek, the balloon would land north of Anderson Ranch Dam in the mountains. The results showed the following for 1200fpm ascent, 90,000 ft burst and 800 fpm descent:

Lat 43.9848
Long -115.8411

Bearing 49 degrees
Distance of 80 miles
Time of flight 142 minuts.

Did anyone else do this prediction?

With the above information, if launched from the vacinity of Brunea State Park the balloon would land north of Fairview and about 10 miles west of Highway 75.

As indicated earlier, the MRF is showing a change in the upper winds and the prediction should be similar to the last flight we did with the winds shifting from the Southwest to the Northwest.

Dan, I'm at school right now. If you'd like, you can drop it off at the front desk. The school is on Victory, just west of Cole. We're on the south side of the road, up a small hill. There's a sign in the drive. We're opposite from the road, S. Saturn. Jupiter is closer to Cole. From the road, the first building you'll see is the new district office. We're behind it, a bit more to the south.

Paul,

The bunnies made a necklace out of the beads but I retrieved them.

I have one Thermochron. That makes four. I would also like to measure the temperature inside my capsule both inside and outside of the battery box. Can we make use of the temperature array?

I have completed the bead holder. I'm almost done with the battery box.

I finished and tested the PCD (payload cutdown device). It works with my small glider. Weight is not a problem. We'll save your big glider for another mission.

Paul,

I have called the pager and tested the PCD (Payload Cutdown Device).
It's working good.

Jeff

Doug,

The pager number is 467-9820.

The plan is to call the pager every 10,000 ft and enter a number representing the current altitude on the way up, for example 30,000 ft would be 333-3333. The first time you call it will drop a small glider. After that were just recording the altitude. We are not going to try to recover the glider. It's value is $1.69. I don't know at what altitude Paul wants to make the first pager call.

My array won't reach high enough. I'll use three thermochrons and
the array on the thermo experiment. That will give me a good
comparison.

No no no....

I don't want to make the first call. I'm concerned about the balsa glider crashing into a nuclear power plant and causing an accident!

Actually, let's make the first call at 50,000 feet to release the glider. After that call every 10,000 feet to the max altitude of 125,000 feet (I wish). Also, let's have Doug make all the calls, it's more certain to work that way. We may be in and out of cell phone range.

Here's an idea for calling the pager that I think would be kinda fun, and useful at the same time. If the person thats calling is in range of a repeater with an auto patch, do it that way !!!! Everyone monitoring that frequency will know when the pager is activated.

Tim.....

Doug, will you be recording the repeater traffic mobile or at home?
Do you plan to chase?

We need someone to call the pager at 50,000 feet. By the way,
Jeff, can you call the pager as see if it will ring? I want to make
sure it hasn't been turned off.

Anyway, we need someone to call the pager. It would also be nice
to have someone act as traffic controller on the repeater. Doug?

Paul

1137. Flight Prediction

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-13 21:01:19 UTC
From: Jeff Melanson
Topic: 1137 Message: 1137

Hi all,

I ran a prediction with the following parameters.

Ascent rate: 800
Descent rate: 1200
Burst Alt. 90,000

Location: Succor Creek
Lat 43.23008
Lon -117.06147
Alt. 4800 ft

Upper Air Station KBOI @ 1200 Zulu

The result was a trip of 51 miles bearing 39 degrees.

This places it about 2-1/2 miles on the east side of Hwy 16 near
Freezeout Hill. I expect a lot of change this week. It's probably better
to study the MRF till we get closer to lift off.

Were not going to let a little rain stop us are we?

Jeff

If we can launch without rain, then we're go. However, I don't remember what FAR 101 said about cloud cover. There may be no limitation since we're under the two six pound rule, but I need to reread.

Because 147.240 is the chase frequency and does not have a patch, no one monitoring the chase will hear the call. Those that hear the call will not know what it is about.

I didn't get back to this board until 3:30. My wife kindly reminded me one of my Children is turning 10 on the 14th. I had to madly scramble. Where do the years go? Heck, where do the minutes go? I'll just drop the receiver by the desk with Teri. I'll get a note to you.

Bill,

I download the data from the following website:

http://www.stormchaser.niu.edu/machine/textsound.htm

Typical acent rate is 800 to 1000 fpm and descent is 1200 fpm. These are based on experience. The burst altitude is determined by balloon size, payload weight, and experience. This particular balloon has a thicker skin that previous balloons. It will be interesting to see how it actually performs.

Doug,

When I access the URL I get a link list of available data. When I select SOUNDINGS and either LISTING or SKEW-T I get RAOB data for 0000Z 31 DEC 99. I do not see a way to change the requested date. Do you have instructions for the old and tired?

For more information start one page sooner at:
http://stoat.uwyo.edu/surface/city.html

It does not look like you will get more than the most current informaiton.

From: Mark Conner
Topic: 1137 Message: 1153

The stoat.uwyo.edu site appears to have problems. Most of the data is from two days ago, except for the upper-air which is from 31 Dec 99 0000Z. I checked against other sites to see if the data was just labeled wrong - the data that's there is not this morning's sounding.

On a related topic, using forecast soundings directly in WBALTRAK is easier than taking a current sounding and adjusting it mentally.

Within 48 hours of launch, use http://www.stormchaser.niu.edu/machine/textfcstsound2.html and choose the "Eta" model.

For beyond 48 hours, go to: http://gus.arlhq.noaa.gov/ready-bin/profsrc.pl?metdata=MRF+191+km Enter the nearest 3-letter airport ID at the first page (or lat/lon to nearest degree - precision not necessary here). Then select the date/time of the launch at "Choose the time (start for animation) to plot". Hit "Request Plot" at the bottom, then when the graphic comes up click on "sounding text". Feed that text to WBALTRAK and you're set.

Using current soundings 3-7 days out and adjusting them mentally is like using a chain saw after you've marked your cuts with a micrometer. I've tried it myself and never had any luck, so I went to using the forecast soundings. Still more precision than accuracy, but it's better.

If the forecast sounding does not go high enough, you can tack on the current sounding's data on top of the forecast sounding. Typically, winds don't change much day to day above 60,000 ft. Even if you do have forecast data above 60kft, I think it's better to replace it with the lastest "real" data as the models don't have much resolution or accuracy above that level.

You can also get the current BOI sounding at: http://weather.unisys.com/upper_air/skew/skew_KBOI.txt

If you have questions just drop me a note.

I'm finishing the battery warm box between classes today. The dropzond port is finished and attached to a capsule boom. I tested the seperation mechanism and got that nice orange glow that comes from 8 amps flowing through 3" of 30 gauge nichrome. The camera is loaded with film and batteries have been replaced except in the GPS. The GPS batteries still have a good 12 hours of life in them.

The flight batteries all show a high charge, which surprises me, since I don't recall recharging them. As I have not taught the rabbits how to do that, I don't think they recharged them either. I'll run the batteries down and recharge them over the next day or two.

The flight program was updated last night. I added code for the RC test. I still have to tie the dropzond onto the port and add the RC reciever before I can close out the capsule.

John Stone, will you be doing the launch? We should pick up a half tank of helium, just in case. Mike, can you do that? I'd also like to see if we can collect a few dollars to pay for the tank.

Doug, can you make this Friday's meeting? I'd like to discuss with you the mission control part of the flight.

We need a little extra helium just in case.

Paul

Has anyone used Liftwin? It's a program used to predict ascent rates and max altitudes, based on payload weight, volume of helium, and balloon size. I haven't used this program in many years (since I left Kansas). I'm arranging for a presentation on this program. I'd like to see TVNSP test the program next year.

Oh, 2/3rds?
I thought we used up about half the tank. In that case, we should
be fine. Thanks for updating me.

Except for could cover, another good site would be to go out to the top of the drop down to Swan Falls. Even better would be to head east on the dirt road past the repeater(?) building at the turn into the drop. There's a spot out there that gives an awesome view of the horizon, weather permitting. Can't remember just how far out it is, I'm still trying to get the co-ords from a friend, but it's a ways.

If it wasn't enough to launch on Saturday and have a TVNSP meeting on Sunday, there's a meteor shower Saturday night. The Leonids are most active in 33 year intervals. This year's shower could be major, really major. I plan to watch it from Bogus Basin (or there abouts), that way I'm above the clouds and lights of the valley.

Is anyone interested in seeing the meteor shower? If you have a camera with a bulb setting (and a cable release) you can photograph the shower.

The predicted maximium for North America is at 3:00 AM Sunday morning.

Paul

A couple things we need for the next launch...

We need a picture of crew moving the stack, with care being taken to keep parts of the stack from dragging on the ground.

I'd like to get a video of the entire launch process. This winter I'd like to put together a how-to video.

We need a good picture of the capsule as it parachutes down. I'll keep my fingers crossed on this request.

On the checklist, the following items need to be added....

Connect power for the Dropzond
Set timer on FTU
Connect power for FTU
Open camera after powering up the capsule
Turn on audio beacon

Telemetry will give temperautres for the thermo experiment. the channels are....

CH1: MLI Only
CH2: MLI + Styro peanuts
CH3: No added insulation
CH4: Styro peanuts only

This data is the temperatures in each box

Paul-

I have a super 8 Camcorder and an S-video VHS VCR at home. I can get
you pretty good video for an amateur photographer. I also have an
Olympus OM-10 for stills. I would be happy to work both Camera's if
folks will be willing to take a few takes. I don't mind stepping up
and getting in peoples faces for a worthy cause. I had already put
them on the list anyway. Just assign me as the ground cameraman
unless I'm needed elsewhere.

How about testing it right now for the weekend flight?

If someone could just post the balloon weight, the
total payload weight (everything except the balloon),
and optionally the balloon manufacturer, I'll run it.

Here's a link to the software -- it shows a screenshot
which really tells you a lot about the program just
at a glance:

Just received my Oncore M12 GPS unit and antenna today. These things are tiny! The antenna is about the width of a quarter and a bit longer. The antenna and GPS unit weigh a total of about 2 oz. The GPS unit was about $80 and the antenna $27.

The connectors are a little hard to find. They are on 0.05" centers instead of 0.10" and are not available from Mouser or Digi-Key. I was able to get samples from another manufacturer - contact me if you need details.

I'm planning to put the GPS unit in a small case with a TinyTrak II. The radio to be used is a VX-1R and is about 5 oz with its own battery. Three AAA batteries will supply 650 mAh at 3.6V, which should be enough to run the GPS, antenna, and Tiny Trak for six hours or more. Since the TinyTrak uses 5V and the GPS/antenna use 3V, I think I'll use a DC-DC converter rather than more batteries to up the voltage.

Doug and Paul-

I know its not the best timing with the launch coming up but,
I looked back through some old messages that had been posted
before I got onboard.
Is this something that was going to get under way in the future?
I certainly see a need for me to get some training on the Basic
Stamp as we embark on the beginning of the NSRV project.

I know it is a little further away, but I suggest the best place around for viewing will be at the Bruneau Dunes observatory. We've got good skies except for a little city glow to the north. We will have telescopes out for something to look at before the storm, and a place to warm up if you get too cold. The weekend is supposed to be for astronomers, but I guess if you are out to watch the meteor shower you should be welcome too. The event starts at dusk, and we will probably be doing a special show pointed more towards astronomers than the general public. (As long as at least ten people show up, which looks pretty certain.)

If you can't make it before dark, you are still welcome, but BE SURE TO TURN OFF YOUR HEADLIGHTS WHEN YOU MAKE THE TURN INTO THE OBSERVATORY AREA!

Okay Dan, we'll make you the cameraman. However, we also
need to get you some training.

> **********how will RC signal be checked? Telemetry? on board count?

The RC test will send telemetry like this,

RC 1024/784

The first number is the number of counts in 1 second, the second
number is the altitude in meters.

We need an APRS tracker at the meeting to finish testing the
capsules.

> Just received my Oncore M12 GPS unit and antenna today. These things are tiny! The antenna is about the width of a quarter and a bit longer.
The antenna and GPS unit weigh a total of about 2 oz. The GPS unit was about $80 and the antenna $27.
>
> The connectors are a little hard to find. They are on 0.05" centers instead of 0.10" and are not available from Mouser or Digi-Key.
I was able to get samples from another manufacturer - contact me if you need details.
>
> I'm planning to put the GPS unit in a small case with a TinyTrak II. The radio to be used is a VX-1R and is about 5 oz with its own battery.
Three AAA batteries will supply 650 mAh at 3.6V, which should be enough to run the GPS, antenna, and Tiny Trak for six hours or more.
Since the TinyTrak uses 5V and the GPS/antenna use 3V, I think I'll use a DC-DC converter rather than more batteries to up the voltage.

It sounds good as a backup tracker. The GPS is the same price
as the Etrex. However the weight is significantly lighter than the
Etrex.

This is a group Doug has started. we meet about an hour before
the VOI meetings (2nd Wed of the month). I'd recommend it.
We're just starting, but I think the group will get into programming
stamps.

Okay, Paul has supplied me a few numbers for this Saturday's flight. I've asked him for a clarification on those numbers, but for now LIFTWIN is telling us that the helium needed will be around 340-380 cubic feet.

There is a range involved because of that additional email I'm expecting later today from Paul. Also, this is for about 1000 feet/minute ascent speed. Due to the time of year, you might want to go a little higher on the rate of rise so as to shorten the time in flight, and therefore the total distance to landing.

LIFTWIN, as the screenshot shows, is a sort of balloon spreadsheet program. Playing with it you can learn a lot about how to juggle balloon inflation values to achieve a desired result.

One of the most important things for flight and recovery planners to remember is that a tracking program needs a good ascent rate in order to get a good landing zone predict! Give Balltrak a good estimated ascent by feeding it a good result from LIFTWIN. If you want to incorporate experience, and I recommend that, at least start with a figure from LIFTWIN, and then finesse that.

And of course, LIFTWIN should never allow you to run short, or even too close for comfort, for helium at hand.

Typically we use about 2 pounds of positive lift. But since we're filling outdoors, we can't be exact, so we may dump in extra helium.

Wind shouldn't be that much a problem for something like this. You can always park your vehicle such as to block the wind, I'd think. Myself, I'm thinking of going either there or out to my sister's. Should be great viewing, there's some predictions for the Boise area at http://www.space.com/scienceastronomy/astronomy/leonids_citytimes-7.html (Thanks to Bill Herrmann for the link).

How do we know if we have 340 or 380 or whatever amount in the balloon?
What we know is how much positive lift we have by using a scale.

From: paulson58@juno.com
Topic: 1182 Message: 1182

Paul-

If you get a few spare minutes, could you jot down an Outline for what you want filmed on Saturday Morning. If you can get me a general list by meeting time to review, this will make it easier for me to make "Film Rounds" as launch time nears. That way I won't miss anything you want to show folks.

1183. Status, 15 Nov

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-15 19:47:38 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 1183 Message: 1183

I just looked at the weather report and MRF (I'm not happy).

The weather is predicted to be cloudy on Saturday. The MRF shows winds aloft becoming very strong and from the southwest (12Z Saturday). Wind speeds over the TV are predicted to be 80 meters per second, which I calculate to be about 180 mph! So we're predicted to have a strong jetstream overhead. However, the jet is usually thin. Nonetheless, this still may be a long chase. The sonde launch this morning from BOI only send data up to around 46,000 feet. The MRF analysis (winds right now) show the winds aloft are weak overhead. So any prediction made right now wouldn't be accurate anyways.

I ran a test on the capsule this morning. The batteries in the GPS died during the test and the CC/PS sent a message to that effect. I've replaced the batteries and now the GPS shows fully charged batteries.

The RC test showed the RC was truned off. I need Dan to bring his RC transmitter to dinner tomorrow for a full test.

I'll tie the Dropzond to it's dock tonight. There is one message I need to change in the flight program and I need to get one more BNC barrel connector.

As far as meteors, I'm wondering if it will be clear at Bogus.

--- Jeff Melanson <kd7inn@...> wrote:

JM> How do we *know* if we have 340 or 380 or whatever amount
JM> in the balloon?

Jeff,

You *don't* (at least not directly) under most circumstances.
The idea of the volume result is just to know how much gas
you'll need (size of tanks, number of tanks to have, etc.)

This program should be used before you arrive on site. It
can be used on site, too, but the idea is to plan with it
and not have surprise result after the balloon leaves
the ground, or have to snag helium at the last moment.
It HAS happened to several groups over the years.

There are other purposes to knowing your gas volume, too,
but I won't go into all the fine details right now. I think
you'll find the instructions with the program to be pretty
informative, and they're not too long.

JM> What we know is how much positive lift we have by
JM> using a scale.

I and everyone else do the same thing.

LIFTWIN will tell you how much of that positive
lift, which is also called freelift, that you'll get with
a given amount of gas.

We'll need some place outof direct sunlight. Close access to
water is also needed. And power.

Paul

1187. RC Transmitter test

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-15 21:53:36 UTC
From: paulson58@juno.com
Topic: 1187 Message: 1187

The RC test showed the RC was truned off. I need Dan to bring his
RC transmitter to dinner tomorrow for a full test.

Paul-

You got it. If you have a way of generating a TTL pulse anywhere from
1ms to 2ms duration at 55 to 65 Hz this should do the trick just for
a test.

Like......

```
x var word
output 12 'pick your own pin of course

test_pulse:
for x = 1 to 100
pulsout 12,750 'pulseout ( ), whatever you picked above
pause 15
next
goto test_pulse
```

And inject this into the pin you selected for the RC receiver pulse
in, it will tell you if it'll work. I will bring the Transmitter to
the meeting though. Your right, the final test sure must be
accomplished to know for sure. (You probably already did the above)

Oh, I know it will work, but I don't have a transmitter to operate the
receiver and see the results.

Hmmm. Given all the pessimism in here, I'm tempted to ask if anyone knows of any virgins we can sacrifice. (very, very tongue-in-cheek)

There's been a lot of mention of the Dropzond of late, I need to ask what that is.

This reminds me, I'm planning to be there for the launch for sure, and set up to chase. I am recovering from having hurt my back Monday, so will not be able to physically participate much in the actual launching. I will, however, bring my digital camera and take as many pictures as I can, and of items specifically desired. Like Dan, if you could give me a list of specific pictures desired (I think I saw a partial list some posts back?), I'll be happy to ensure they get taken.

Zond is russian for probe. So its a drop probe, simpliar to the drop
probe on the Galileo of the Huygens on the Cassini. Eventually I'd
like to recover them, or have them transmit data to the capsule.

Paul,

If you want I can pick up another tank of helium tomorrow, just to give us that warm fuzzy feeling at the launch site....we are going for 120,000 feet, aren't we?

Doug, would you say we only used a third of the tank to fill the rest of the balloon for the parachute testing?

We're going for that altitude, but I don't think the balloon is
;)

We should make around 90,000 feet. I would feel better if we had a
little extra helium....

I promise not to inhale, this time.

I'm not either. Just ran a prediction from this mornings flight data. The travel at a bearing of 50 degrees, distance of 60 miles, and time of 110 minutes. Since I don't have a map program on this PC I can't tell you where that puts it, except if launched from Succor Creek it would land at:

Lat 44.3076
Long -14.9931

The Boise Weather service forcast is:

SATURDAY...CLOUDY WITH A 40 PERCENT CHANCE OF SHOWERS... COOLER WITH HIGHS IN THE MID 50S. LIGHT WINDS

The MRF is still showing the same direction on winds, in fact a little stronger than currently.

Paul, did I do this right?

See everyone tonight

Winds aloft look much better for Sunday. We'll habve a low pressure system parked just to our northeast. winds will be weak and from the northwest.

However, sunday moring is predicted to be cloudy with a chance of snow. Sunday afternoon will be clearing.

If we launch on Saturday morning, we'll need to go someplace like Rome.

Topic: 1164 Message: 1215

That's good news. I'm still planning to attend tonight, but may have to leave early, due to family request.

BTW, anyone know if Stephanie is going to be there tonight?

Bill B.

1216. Forecasted landings

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-16 18:49:29 UTC
From: Mark Conner
Topic: 1216 Message: 1216

I can't access the msg archive from here, so I'm not sure what's actually planned for ascent/descent rates. For the calculations below, I used 1000 ft/min for ascent and 1200 ft/min for sea-level descent, burst of 90,000 ft. Forecasted winds were used up to 55,000 ft, then current winds above that.

If launched this morning: 63 miles at 055 degrees from launch
Saturday morning: 80 miles at 048 degrees
Sunday morning: 48 miles at 125 degrees

Timing the arrival of the next system is going to be tricky. The rain may hold off until late morning Saturday, but could hang around into early Sunday morning. Should be cloudy Saturday morning, maybe some breaks Sunday morning. Conditions will improve into the day on Sunday. Surface winds don't look like they'll be a problem.

Does anyone have a map? If launched from Rome, does 80 miles
at 48 gegrees put us in a good spot? Sunday's flight looks more
like TV01G's flight. Of course the rain is a problem. Nice to hear
surface winds are not likely to be a problem. I'll take good news in
small pieces if necessary.

Clouds!!!

Is there any place to watch the meteor shower?

Paul

1219. $GPGGA AND $GPRMC

Yahoo group: tvnsp (2000 — 2002)

From: Jeff Melanson
Topic: 1219 Message: 1219

The Northwest APRS website

http://www.nwaprs.org/aprssettings.htm

says don't use a combo of $GPGGA and $GPRMC.

Why? Don't we need both on the balloon flight?

Jeff

Since NWAPRS has never launched a balloon, they don't know
what we need. I'm interested in hearing their explanation, though.

Jeff, will you have your tracker with you?

Paul

Paul is correct. These settings were never intended for a balloon. These recommendations are for trackers and mobiles. The reason for this recommendation has to do with the amount of traffic on the network. Using both strings causes double the amount of traffic from each station and is unnecessary for trackers and mobiles but essential, as we all know, for balloons.

The GGA gives us time, lat, long, and altitude.
The RMC gives use time, lat, long, speed and direction.

Watch out. You may go into data overload!

Actually on the last flight I was transmitting much more often. I had set the two strings to transmit at different intervals and at odd intervals so they would not overlap. This way the Street Atlas screen would alternate between showing altitude information and speed and track information. If I set them to the same interval and they transmit at the same time then Street Atlas would only display one or the other. For example you would see altitude each time it transmitted but not speed and track. I could not find any rhyme or reason as to which one it chose to display. Of course you could go to APRS history tab and see what it was doing but I wanted all the info on one screen. One way to do this is to transmit the GGA string every 15 seconds and the RMC string every 19 seconds. Both strings are then displayed on the screen as they come in. Of course this means transmitting about 7 times per minute. Does that sound like to much?

From: BLOHM,BILL (HP-Boise,ex1)
Topic: 1219 Message: 1233

This is a perfect case for smart beaconing! Except for the case where it rises straight up.

How fast does the balloon move?

Also, remember that altitude is not a primary function provided by the GPS setup. Position accuracy is favored over altitude, to the detriment of altitude readouts. If you put your GPS in a stable location and run something like VisualGPS, you will see that the position will stabilize but altitude will always be wide-ranging. Still, some data is better than nothing.

Running a tracker at 1 per min provides me with data at the rate of approx 9 posits between my QTH and HP, going north from Nampa to Hwy 20/26 then east. So, that's almost a posit every 2 miles at 55-60 mph. Obviously, we want as much data as possible from the balloon in order to accurately track it's path, altitude, and speed. Does the balloon also send telemtry packets on the same frequency? If so, then we're going to risk heavily loading the APRS freq with packets that many people simply won't be interested in.

Using both GPGGA and GPRMC, it will take about a second to transmit both. Maximum data could be obtained, probably, with a transmit rate of 1 per 15 seconds and stagger them. Unfortunately, this would probably "overload the system". I'd say that we should probably transmit each one 1 per min, alternating so that they are 30 seconds apart. I wouldn't recommend pushing it past that.

If we're running two trackers in the launch, we also need to co-ordinate the two so that they don't both broadcast every minute on the minute, etc..

What I would like to propose here, is that we remember that the APRS frequency is a public frequency, but it is also a gentleman's agreement. As a result, we do not have to stay on 144.39 MHz to use APRS. This time around, we will have to, to be able to use the system, obviously. Next and future launches, though, we should consider using a clear frequency for our transmitting and data logging, and feed this at a modified rate into the IGate. That will allow us to make maximum use of the largest amount of data we can handle without loading the APRS frequency.

1234. Tiny Track II

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-16 20:15:29 UTC
From: Jeff Melanson
Topic: 1234 Message: 1234

Tiny Track Experts,

Does the Tiny Track II transmitt the GGA and the RMC strings? Is this something you program?

> strings? Is this something you program?

Not exactly - It transmits a more compact piece that incorporates that data.

It happens I was testing mine this morning. A typical packet looks like:
KD7MJC-9>APT202,WIDE2-2/1:!4342.94N/11621.24W>178/006/A=002621

You can see a range of them at http://www.findu.com/cgi-bin/rawposit.cgi?call=KD7MJC-9

That smaller string incorporates position, heading, speed and altitude.

The TinyTrak config. utility includes a switch for transmitting altitude. It also can transmit in Mic-E format. (Note that the current version of TinyTrakII can not do "true" Mic-E in that it doesn't monitor the PTT line.) Not an issue here, of course. Obviously the advantage of Mic-E format is more compact data. I don't recall if Mic-E included altitude, but I think it does. (I'll check later, got the spec at home.)

Just wanted to mention that Sunday is doable for me if it's decided that we should move the launch. (It's actually better for me.)

Bill,

I have noticed on APRS+Street Atlas on the position 2 tab that most
units transmit either Speed and Track or Altitude but not both. However
some units transmit Speed Track and Altitude all at once. Is this done
with a Tiny Track II?

From: BLOHM,BILL (HP-Boise,ex1)
Topic: 1164 Message: 1238

I was hoping to meet Stephanie at the meeting, but earlier I got word of a family function, and since family comes before hobby, it looks like I'm not going to be able to make this meeting at all. :-(I was really looking forward to being there and seeing how the planning went, when we'd launch, and help make sure the trackers were working OK.

Dan has his setup and will be there, so that's covered.

Bill H. has asked that someone post the launch time/location to this list after the meeting, and has agreed to send me a one-liner letting me know the day and time. I can run either day, but have to admit that I'm not exactly looking forward to launching from Rome! I've mentioned before I think it's wrong to beat the sun up. ;-)

Stephanie, I still would like to meet you and talk about APRS with you, maybe we can work something out sometime soon.

1239. Posits, time slotting, etc.

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-16 21:19:23 UTC
From: Mark Conner
Topic: 1239 Message: 1239

TinyTrak II will assemble info from GGA and RMC strings into an all-in-one posit. Both the text and Mic-E format can be set to contain altitude. The downside is there is no time information contained in the report, making log file analysis difficult. I'll use a TinyTrak as a backup beacon, but not as a primary. My own preference is to send text information instead of Mic-E format, so I can extract lat/lon/alt from the raw TNC data in the event of some ground station failure.

For NSTAR, I include the time (hour/min/sec) in the posit, so that all information is contained in one packet. This make logging and computations much easier. I can send BS2SX code if anyone's interested.

If you are using a KPC-3Plus, you can time slot your reports. You can do the following to alternate GGA and RMC posits:

```
GPSHEAD 1 $GPGGA
GPSHEAD 2 $GPRMC
BLT 1 EVERY 00:00:30 START 00:00:01
BLT 2 EVERY 00:00:30 START 00:00:16
GPSTIME VALID RMC
```

(I think the commands are correct - don't have a manual at work)

This will set the TNC's time to the GPS, beacon a GGA string at :01 and :31 seconds after each minute, and beacon an RMC string at :16 and :46 seconds after each minute. This will make a nice alternating display on APRS+SA of course/speed and altitude.

BTW, due to a software coding error on my last flight, the beacon sent out posits every 6 seconds for abour 40 minutes. Nobody complained. :)

Mark,

That programming is just what I needed for the KPC-3Plus. Thanks.

One more question. The KPC-3Plus will delay it's transmission if the freq is busy (if you allow it to litsen). Will that change the timing or just delay the transmission?

Jeff,
In my experiences with the Womens Challenge cycle race, both the GGA and RMC string are equally important, and I would think even more so on a balloon tracker, because one outputs information the other doesn't and visa versa and some of the unique data of each is important for tracking purposes.

The Northwest APRS website

http://www.nwaprs.org/aprssettings.htm

says don't use a combo of $GPGGA and $GPRMC.

Why? Don't we need both on the balloon flight?

I don't recall there being a problem.

What if you have each sentence transmit every 30 seconds. The
GGA transmit at 15 and 45 seconds after the minute and the RMC
transmits at 30 and 0 seconds after the minute. This gives a
constant 15 seconds a part between updates.

Paul

Something to keep in mind......time interval on battery power !!!!.....a time interval of 30 seconds will be transmitting twice as much as a time interval of one minute, thereby halving your battery life. Personally, I think a one minute, or thereabouts, interval would be sufficient for a balloon tracker.

Tim....

To:tvnsp@yahoogroups.com
Subject: Re: [tvnsp] $GPGGA AND $GPRMC

Watch out. You may go into data overload!

Actually on the last flight I was transmitting much more often. I had set the two strings to transmit at different intervals and at odd intervals so they would not overlap. This way the Street Atlas screen would alternate between showing altitude information and speed and track information. If I set them to the same interval and they transmit at the same time then Street Atlas would only display one or the other. For example you would see altitude each time it transmitted but not speed and track. I could not find any rhyme or reason as to which one it chose to display. Of course you could go to APRS history tab and see what it was doing but I wanted all the info on one screen. One way to do this is to transmit the GGA string every 15 seconds and the RMC string every 19 seconds. Both strings are then displayed on the screen as they come in. Of course this means transmitting about 7 times per minute. Does that sound like to much?

My CC/PS does that. But it's only as smart as the programmer.

> How fast does the balloon move?

Depends on the wind. I've seen them go between 0 and 120 mph.

> Does the balloon also send telemtry packets on

> freq with packets that many people simply won't be interested in.

Balloons send data on the same frequency. However there's a lot
of interest in seeing balloons on APRS. Here in the TV there just
isn't that much traffic to start with, so I don't think anyone is going
to complain. And so far, no one has (at least as far as APRS
traffic). My recommendation to those who feel balloon traffic is a
burden is for them to get involved with TVNSP.

We want to stay on 144.390. Findu and other websites depend on
that frequency. Several people in the midwest keep track of
TVNSP flights through Findu. It has something to do with keeping
me honest.

Jeff,
It won't change the timing, just delay it until the frequency is clear. Also, the carrier detect needs to be set to SOFTWARE ('cd software' command).

From: Bill Herrmann
Topic: 1250 Message: 1250

One thought - it might be wise for us to send out a bulletin with what is going on before we start sending tons of data across the air. Kind of a preemptive strike if you will.

I'd include the callsign(s) to be used and the website URL for more information. Estimates of times would probably be a good idea as well.

We "should" be able to send that out from the launch site since we'll have APRS stations present. Might not hurt to send out at least one bulletin this evening.

From: BLOHM,BILL (HP-Boise,ex1)
Topic: 1219 Message: 1251

Strictly speaking, this isn't true. Findu and other websites depend on internet feed to their sites to provide them data. This feed is provided via IGates. So, all we'd have to do would be set up a temporary IGate on the frequency we used.

But as Mark said it doesn't transmit time.

I wasn't aware that there was that much interest in the balloons in the APRS community as a whole. Thanks for that information.

Overall, I'd agree with you, but there are regular bursts of "a high volume of" APRS traffic and that traffic seems to be growing as the APRS network gets more and more interconnected. For that reason, and so that we could obtain all the data we ever wanted to roll around in and play with, I suggested looking into using a different frequency _eventually_. I do agree that for now we can probably get away with it, but I am not sure (and hope that it won't) the frequency will stay this "quiet" in the area. I want to see more use of APRS in the area, hopefully expanding into SAR efforts. We should plan for that eventuality, I believe, rather than having to do so immediately the need arises and we start getting complaints.

I like your recommendation!

Bill B.

> One thought - it might be wise for us to send out a bulletin with what is going on before we start sending tons of data across the air. Kind of a preemptive strike if you will.

We can send that over APRS. I'd also like to send a bulletin over the repeater.

> We "should" be able to send that out from the launch site since we'll have APRS stations present. Might not hurt to send out at least one bulletin this evening.

As I recall, we had trouble reaching the repeater from Rome. Was APRS available?

We need to notify Doug as soon as we can that the capsule has been launched. He'll act as net controller and pager controller.

Correct, Paul. That's how our trackers and QTHs get into Findu: the IGates monitor 144.390 and feed it into the internet.

I think it's primarily because its new and seldom. If we were to
launch everyday, that would be a different matter. Sort of like the
space program. I think people like seeing an icon on their APRS
that says 100,000 feet. Come to think of it, so do I.

From: Mark Conner
Topic: 1239 Message: 1264

Are you planning to have the balloon listen to 144.39?

I generally run my packages "deaf" to avoid the likelihood of having continuous data carrier detect at high altitudes. Most APRSers don't mind getting stepped on now and again by a special event like a balloon flight.

I have, however, set odd splits on the balloon's radio to listen to a simplex frequency but TX on 144.39. This allows me to digi my car's position through the balloon when I'm out of terrestrial digi range, but I don't have to listen to .39 with the balloon.

1265. $GPGGA AND $GPRMC

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-16 22:18:49 UTC
From: Jeff Melanson
Topic: 1219 Message: 1265

I have programmed the TNC per Mark Conner's suggestion and tested it in the capsule. It work's as advertised. There will be a transmission every 15 seconds alternating the GGA and RMC strings.

For battery power I have an external battery pack of 4 AAA batteries in an insulated box inside the capsule. This provides 6 volts to the radio (Alinco DJ-S11). I had no problems on the last flight and still had plenty of battery power left over.

I also placed external battery's for the Etrex GPS in the battery box. The GPS senses the external power and runs on the external batteries. If the voltage drops to low it will switch to the internal batteries. I tested this to verify it.

The TNC has an internal 9 volt battery. This worked great on the last two flights.

Either software or internal should work for this purpose. Of course, if we're going to run the balloon "deaf" you could just set it to external and not supply that signal.

We are planning to meet at Valivue Junior High (old high school) no later than 5:00am. We will launch from the Rome Launch Site, need to be there around 6:30am.

This evenings prediction is holding up Mark's prediction for Saturday. I got the following for a 1000 fpm ascent rate:

Bearing: 47 degrees
Range: 80 miles
Minutes: 86

The max winds are at 35,000 ft, 74 mph, range 80 mi, and time of flight of 86 minutes.

At 800 fpm ascent, the figures are:

Bearing: 47 degrees
Range: 94.5 miles
Flight time: 142 minutes

See you in the morning.

high school) no later than 5:00am. We will launch from
the Rome Launch Site, need to be there around 6:30am.

This evenings prediction is holding up Mark's
prediction for Saturday. I got the following for a
1000 fpm ascent rate:

Bearing: 47 degrees
Range: 80 miles
Minutes: 86

The max winds are at 35,000 ft, 74 mph, range 80 mi,
and time of flight of 86 minutes.

At 800 fpm ascent, the figures are:

Bearing: 47 degrees
Range: 94.5 miles
Flight time: 142 minutes

See you in the morning.

John Knapp
KD7HGS

The balloon is on its way down now, currently at 15,000 ft a few miles SW of Caldwell. At least Paul will have a short drive home.

Burst was about 93,373' at 1630 UTC.

It appears TVNSP's recent flight is on the ground now. Last report was at less than 2800 ft. The attached map shows the balloon has landed within the Caldwell city limits, about a mile from Paul's house.

Hopefully it's not in a tree, building, or on the railroad tracks near the last position.

Just got one on-the-ground report - it's near a street corner and away from the tracks.

Everyone,

I hate to be the bearer of the bad news, but TV01H landed in a set of live power lines, causing some heavy arcing between the capsules and lines. There was definite damage done to Pauls capsule...The Darigold dairy plant nearby is claiming to have lost power due to this, and claiming lost product, etc., but some businesses directly under the power lines did not lose their power at all.

Unfortunately, Idaho Power came out and retrieved the capsules from the lines, but would not let us have the capsules back. The foreman was very abrupt with Paul, and literally tossed the capsules and parachute into the back of the truck, and went to take off, without a single word to us. Luckily we stopped him and were allowed to turn the power off to the surviving gear before he left.

We did have a local TV reporter from FOX-TV come down to interview Paul and us, hope to see something positive and inexpensive result from this. The same TV station did a story on Paul before, so we hope they can help out in this situation.

A very dark day for TVNSP.......

Mike Garske KC7DPD

P.S. Any other questions in regards, please direct them to Paul.

Oh my goodness......this is certainly worse than the experience I had with power lines. If it's any consolation, KD7INN-11 was still functioning after contact with the lines, and perhaps at the time it was shut off. So when you do get the payload back, it should have usable parts.

Below is a findu.com database extract, showing the payload still moving at 1727Z, stationary at 1736Z, and transmitting a few posits between 1825Z and 1832Z.

KD7INN-11>GPSPO,WIDE3-2/1:$GPGGA,172728,4340.3554,N,11641.5955,W,1,08,1.5,858.4,M,-18.4,M,,*7F
KD7INN-11>GPSPO,WIDE3-1/1:$GPRMC,172744,A,4340.3022,N,11641.5445,W,15.9,139.4,171101,15.4,E,A*0C
KD7INN-11>GPSPO,WIDE3-2/1:$GPRMC,173614,A,4340.2576,N,11641.4587,W,0.0,166.3,171101,15.4,E,A*32
KD7INN-11>GPSPO,SHEPRD*,WIDE3/V:$GPGGA,173628,4340.2570,N,11641.4577,W,1,08,1.8,729.2,M,-18.4,M,,*77
KD7INN-11>GPSPO,WIDE3-2/1:$GPRMC,182544,A,4340.2662,N,11641.4503,W,0.0,259.1,171101,15.4,E,A*3D

That exact thought was what prompted my somewhat inappropriate comments about 'power nazis' and other off the cuff remarks on the repeater. Idaho Power normally will bill you (or put a lien on your real estate) for causing them to send a repair crew to any of their equipment because of your negligence. I have never known them to sieze property that did not intentionally or negligently come in contact with their equipment, and certainly this was unavoidable. I was even more upset to learn that apparantly the repair crew made little or no effort to provide anyone associated with TVNSP with their names, a reciept for the equipment, or any information on who to contact to inquire about retrieving the equipment (that I don't believe they had any right to take). I have several friends that work for Idaho Power, one who is quite high on the food chain. If I can be of any service to help get the equipment back just ask.

>I have never known them to sieze property that did not intentionally or
>negligently come in contact with their equipment, and certainly this was
>unavoidable.

Definitely so. The messages for the past few days show a stong effort to pick a launch site that was predicted to be in a wide open area. The track I have at my QTH shows a very noticeable change of direction in the last few minutes of flight. (The previous direction would have been better.)

At this point I, personally, would recommend that we avoid any speculation about the actions of any one individual until Paul has a chance to work with Idaho Power to find out what is necessary to recover the equipment. I will mention that a Channel 12 (KTRV - Fox) news crew did make an appearance so I'll suggest we watch their news tonight. (Paul did a fine job on the interview IMO.)

I'll also suggest that all of us save any prediction data, wind data, messages that we may still have in case they are needed. Of course, I also have purely selfish reasons in that I did not have a chance to run predictions and would like to try my hand at it.

>(that I don't believe they had any right to take).

It appears that this individual may be in some way associated with the Caldwell police department, though I do not believe he ever identified himself as such. If someone knows how to get in touch with Paul please let me know off list. (The number I have is no longer connected.) I have an antenna question and some other information for him. (Just a reminder that this list is publicly viewable, so we probably shouldn't publish phone numbers etc. on it.)

>several friends that work for Idaho Power, one who is quite high on the

1284. Tracking question

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-18 01:12:17 UTC
From: Bill Herrmann
Topic: 1281 Message: 1284

During the chase we received virtually no data from KD4STH-11. However, it appears that both of our home locations did. It happens we both run virtually identical antennas at home (aluminum J-Poles) so that is one possible explanation.

While we were on the move I suspected it might be related to the software but we both run the same software at home as we were running for the chase, so that seems unlikely. We got a large quantity of data from KD7INN-11 so I'm not sure that I'm willing to believe it's completely receiving station related.

What differences exist between the two capsules that might help explain this? What type of antenna is on the KD7INN capsule? What else?

For the APRS side of things we were running an Alinco DJ195 HT with a linear amp. I've used this setup quite a bit for sending data but not as much for receiving data. They were connected to a KPC3+ with 8.2FW (yes, they made some) Software was APRS+SA 2.01. Bill's QTH was likely on exactly the same version. Mine has a patch on to prevent it from inappropriately gating internet traffic to RF. (A recent fix, which I applied after midnight when I was discovered the problem while prepping for the launch.) Part way through the chase I turned on the built-in preamp in the linear amp. It didn't seem to make any difference.

Any thoughts?

Bill

KD7INN-11 was the top capsule. KD4STH-11 was the bottom capsule. It had the simplex voice repeater and audio beacon on board. Both were still working. (We've told Paul that he has to include a way to remotely shut off the audio beacon in future flights or we'll improvise. <grin> We had to listen to it for some time.)

There was some external damage done to the bottom capsule, but the arcing appeared to come from the additional wind loading swinging the lines together rather than from the capsule or it's connecting lines shorting them.

I provided 22 minutes of todays footage to the Channel 12 folks. About half of it was the pre-launch prep out in Oregon. You made a few prophetic comments Paul.
I gave them the rest from various scenes while we waited at the Landing site. Also, the descent we caught from the Highway.
They said there will be about 30 seconds of story taken from all the footage they have. That's theres and ours combined. It will be on the 9:00 news tonight.

I will be making a copy of all the Footage Paul. I think you will be quite pleased with a lot of the footage at the Launch site. I'm sure you will even get ideas for how to fill in missing pieces of your educational tape.

Subject: [tvnsp] News tonight

I provided 22 minutes of todays footage to the Channel 12 folks.
About half of it was the pre-launch prep out in Oregon. You made a
few prophetic comments Paul.
I gave them the rest from various scenes while we waited at the
Landing site. Also, the descent we caught from the Highway.
They said there will be about 30 seconds of story taken from all the
footage they have. That's theres and ours combined. It will be on the
9:00 news tonight.

I will be making a copy of all the Footage Paul. I think you will be
quite pleased with a lot of the footage at the Launch site. I'm sure
you will even get ideas for how to fill in missing pieces of your
educational tape.

When I returned home I did a calculation from this
mornings data. The result was different from what
actually occurred. Apparently the winds were changing
as we launched the balloon. I have the data printed
off and if anyone wants or needs it I will make copies
of it.

The early parts didn't look to good on the TV Broadcast. I didn't catch that I had started recording the tape for them on my VCR from my Camcorder in SLP mode. They had to then copy that into their format. That's my bust for trying to hurry while living out of Boxes.

The original is really clear as will be our copies.

They got it clear where it counts. Good job Paul.

I think they were right on target as far as the "right" message for this point in the process. Considering what they had to work with and the time constraints I thought they did a nice job of covering the works enough to make the point.

I'm not sure if this is what happened, but we had a similar problem - our testing/home stations would receive but HT's/scanners wouldn't receive on the chase. After talking to a tech at Kantronics, he felt that it was an output-impedance mismatch to the TNC. His theory was that the mobile radios have a lower output impedance than the HTs that are designed to drive small speakers/headphones and the load resistor in the TNC was loading it down too much. I haven't had time to confirm it but it sounds logical.

Our symptoms were similar to yours - our home station would receive just fine (as well as others that were watching the balloon) but the chase vehicles (with HT's) would only receive about 20% of the transmitted packets.

It's been developed quite a bit from the information that's on the site currently. I just submited an article on it to QST (haven't heard back from them yet) so I've pulled most of the info from the website. Currently it's based on a PIC16F876/20 uP and fits on a 3x4 inch PCB. A daughterboard plugs into the back of the PCB to interface with whatever type of I/O is needed.

Hi all,

Thought I'd throw my .02 in here. I had a 100% track on Jeff's tracker from liftoff to landing to electrocution and beyond but only erratic reception of Paul's. From about 9k on up I heard the capsule direct. I was listening with my normal base station consisting of a pair of 13 element yagi antenna's aimed to point directly at the balloon's position, and my regular APRS station which is a Yaesu FT-2600M and Kantronics KPC-3+. I also recieved a message from Dave Dobbins K7GPS in PeEl, Washington, who enjoyed watching the flight but commented that Paul's station was sending out some corrupted packets. I think this might help explain the erratic reception of Paul's tracker.

Also, the best altitude that I have found in the log is 94016 feet. Did anyone get anything else?

1298. Positive lift figure for Saturday's launch

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-18 13:42:47 UTC
From: Hank Riley
Topic: 1298 Message: 1298

I'd normally ask Paul this off list, but he
might have more important things on his mind
right now.

We're doing an experiment and I'm wondering if
there's anyone on the list today who could supply
the measured free lift in pounds or ounces that the
balloon achieved at full inflation before it
was released.

Paul refers to this as "positive lift" and it
would be something like a few pounds. I need
the actual value in this instance, not merely a ballpark
amount that TVNSP customarily uses as a general rule.

It doesn't have to be to the ounce, but I'm hoping someone
has a scale or other measurement to within 4 ounces or even
8 ounces.

When the dust settles from this unfortunate landing
accident, I'd like to do a few more posts about balloon
lift and inflation planning. Paul, Mark, and I had
moved this discussion subject off the list and into
direct email for a few days to cut down on list
clutter.

Hank

By far the most spectacular I've seen in over 40
years of watching (I started young). Missed the
giant one in 1966; I was just reading it was only
good in Western US.

Anyway, at around 5:15 AM EST the one observer rate
I timed for 30 meteors was about 7 minutes, so
it was almost 300/hour. After that I concentrated
on just watching and taking pictures, but I think it
picked up a little by 5:30 AM. With a brightening
sky at 6:07 AM, still saw 2 bright ones within seconds
of each other toward the northwest away from sunrise!

Talked to someone at a better location with
totally clear view to the horizon, and he had
about 600/hour (average of 10 a minute for several
one minute periods), but that may have been with two
people spotting.

I did not get to watch the flight live. But i reviewed the positions in my "history" page. I got 376 reports from Jeff's capsule and 54 from Paul's. It looked like Pauls rmc string only worked part of the time.Looking back through my 'tnc" tab in SA+ the RMC string would not show lat/lon except for every 4th or 5th transmission. Looks like the controller is not working quite right yet.Just my quick observation. Sorry to hear about the bad landing. I do have a log and can provide screen shots with altitude risers on Street Atlas for those that have the program.

BTW, it is Interesting that the balloon appeared to climb in a clocwise spiral to its peak altitude without much north easterly movement as predicted. It almost appeared to be a floater for awhile. It did parall the predicted path perfectlly up till burst and beyond. Just did not go north far enough to miss the pesky power lines. Just my amateur observations.

Hank-

I can get you half way there. Upon completion of filling the Balloon, it had 20.3 pounds of lift.
I do know the Capsules and tempurature experiment ring were weighed the night before launch, but don't have those figures, or how much the Chute weighed. You can probably add an ounce to the measured figures just to be safe. The welded ring, Jute rigging lines and Duct tape used to keep all ends from flying free are not weighed. They only come to an ounce or less I would guess.

Hi all,

We had a good track on my balloon (KD7INN-11) but saw corrupted data from Paul's balloon (KD4STH-11). I have two 2-meter antennas. One for APRS and one for communication. When we were busy talking that would interfere with the reception of data from both capsules. This is probably to be expected since the antenna's are close together. One is on the front of the cab and the other is on the back of the cab. About 3 feet apart.

1304. Mission Number

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-18 18:57:47 UTC
From: paulson58@juno.com
Topic: 1304 Message: 1304

All-

I am Labeling the Tapes from the Launch. I have seen it referred to as TV01G and TV01H. Since I already have a capsule recording from Jeff labeled TV01G, Can I assume this mission was TV01H? Also, Can someone tell me how the Number is read? It seems like TV would be Treasure Valley, 01 would be 2001 and the Alpha designator must relate to that Years Launch? IE. A then B then C etc? I'm not to sure.

1306. RE: [tvnsp] Re: Tracking question

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-18 19:18:53 UTC
From: K7JPS - John
Topic: 1281 Message: 1306

I'm more inclined to think that there might be something with mem module that Paul uses, and the output string he transmits. I believe that everyone in the chase convoy except for myself was using a mobile radio rather then an HT. I also believe that they were seeing raw data on the TNC tab from KD4STH-11 even though it was not being parsed into the tracking tabs.

I have a Kenwood TH-D7A with a Garmin GPS 12 but the HT locked up on me about 4 times before I finally shut APRS down. When the HT locked up, the squelch on the Data band would remain open and no keys would respond, the only way to unlock it was to disconnect the battery, and then the HT would power back on to the state that it had been the last time it was successfully powered down. The only exception to this was that all of the APRS settings had been reset to factory defaults except for the status message which still read TV01H Chase.

Subject: Re: [tvnsp] Re: Tracking question

Hi all,

Thought I'd throw my .02 in here. I had a 100% track on Jeff's tracker from
liftoff to landing to electrocution and beyond but only erratic reception of
Paul's. From about 9k on up I heard the capsule direct. I was listening with
my normal base station consisting of a pair of 13 element yagi antenna's
aimed to point directly at the balloon's position, and my regular APRS
station which is a Yaesu FT-2600M and Kantronics KPC-3+. I also recieved a
message from Dave Dobbins K7GPS in PeEl, Washington, who enjoyed watching the
flight but commented that Paul's station was sending out some corrupted
packets. I think this might help explain the erratic reception of Paul's
tracker.

Also, the best altitude that I have found in the log is 94016 feet. Did
anyone get anything else?

1307. Tape

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-18 19:30:22 UTC
From: paulson58@juno.com
Topic: 1307 Message: 1307

Paul-

I've started this message several times and dumped it. I've looked through the tapes pretty well by now. Some of it evokes the thrill of the chase in a big way. Parts of the end Tick me off today in a way I felt detached from yesterday. I have found myself having a hard time holding back from beating up on the behavior of a certain someone. I do realize that to do so in this forum would be a grave error on my part.

I have weeded out Two hours of pretty good viewing from the Raw Tapes. I think you will like it. I can get you a copy ASAP for your viewing.

Also, I would be more than happy to join you on a trip to recover the equipment when you do so. I will bring the Camera to document any further equipment demise that may have continued. It may look like Roswell's weather ballon scrap by the time you see it again.

When I was on Jump status in Ft Bragg the Jump Master used to tell us, "If your reserve should accidently deploy when the doors are open, You had better beat it out the door no matter where we are. We don't need a hundred thousand dollars damage to the Air Forces' C-130 because your remains peals that doorway all the way down to the tailgate". (Shudder) We protected our chutes inside the Aircraft.

Your Chute was not controled in the back of the transporting vehicle. I hope it didn't "catch air" and pull the capsules out the back while travelling down the road.

>transmitted packets.

In this case I was receiving one of the 2 capsules just fine and the other one wasn't.

I can't tell you how many we received on the chase since we were using (the other) Bill's laptop so that mine could stay home and play IGate. Of course, you could all go look at how many packets I got since they also went to the internet servers. <grin> To save you the trouble my home station got 365 positions for KD7INN-11 and only 89 for KD4STH-11. It is using a dual band J-pole at approximately 30 feet HAAT.

BTW for those not familiar with FindU's other capabilities check out
http://www.findu.com/cgi-bin/track.cgi?call=kd7inn-11&start=96&length=96
(You'll have to change those 96's to a higher value after a couple days)
You can just see a blob at the lower left where the balloon spent some time spiraling.

I was also watching the TNC data coming through and it didn't look like I was seeing it there either, so I don't think it was APRS+ filtering out the data. However, it occurs to me that a small distortion in tone output from that lower capsule could make it hard for a TNC to decode.

Sounds like some tests might be in order once the equipment is available to test.

Bill

1309. It's contagious!

From: Bill Herrmann
Topic: 1309 Message: 1309

The "forgot to mention" disease that is! (Thanks a lot Stephanie!)

Forgot to mention that we were not having the desense problem that somebody mentioned when we were talking voice. However, I had the mobile radio on Cinnabar and was using my HT for simplex communications so that antenna was at least somewhat shielded by vehicle roof from the APRS antenna. I'm not sure which antenna we were using for APRS, but we had a pair of mag mounts on the roof too. (One dual band and one 5/8 whip for 2M.)

Bill

p.s. Since I'm sending another message also check out
http://www.findu.com/cgi-bin/track.cgi?call=kd4sth-11&start=96&length=96
and contrast that with the last one.

Not every packet needs to bw WIDE6-6. Say transmit every 10 seconds but make 1 in 6-12 packets wide. If you are receiving directly from the balloon you get lots of data without clogging the rest of the world.

FWIW:

Regarding this, I should like to point out that the wires in the next droop (don't know what else to call them) between power poles also arced once. If you look at the power poles, it looks as if the droops are isolated (against adjacent pull) enough that we didn't cause that particular arc. I.e. the wind loading due to our stuff over the lines wasn't sufficient to pull the other lines. This was on the side further away from the creamery side and the recycling place the capsules landed over.

Bill's correct. My mobile gear is identical to my QTH gear except for the antennae. The only other difference (even the software is identical) is that I used SA 9.0 in the mobile unit that day, SA 6.0 at my QTH.

Bill,

Here is how that happens...
When arcing occurs in one part of the line a large amount of current is
drawn through the rest of the line. That creates a strong magnetic
feild. This magnetic feild draws the other section (droop) together
until those lines touch. That's why we had two booms each time it arced.

Jeff

I went out to 43d 35.180' N 116d 40.402' W about 0245. I observed to the east, watching about 45 degrees to either side of me and from horizon up to zenith. My best seemed to be 8 in 10 seconds, and I observed 200 in 40 minutes of watching, which would support Hank's extimate of 300/hour. I even saw what appeared to be a couple of skips, where a meteorite would hit, exit, re-hit, exit, like skipping a stone across water. Longest such skip was 3 skips. Even my wife was glad I'd dragged her along to see this.

I got through to Idaho Power. There's no problem picking the capsule up from their Boise Operation Center on Five Mile and Franklin after 3:00 PM today. They have photographed it for their own protection from Dairygold.

I'll see what time they close, as I get off work at 5:00 PM.

Thats great news Paul-

Do you want me to go with the camera then or just back off.
I do have a fairly good shot of your capsule getting shot
like a Basketball by the Confiscating official. It shows it going
from his hands, arcing through the air and disappearing behind the
wall of his truck bed. It's impact is assumed.

Also, if it's a timing issue, I have two windows of opportunity to
get it today for you. One is right now till about 2:30pm. The next
would be from 3:15 till however long it takes. (That would be better)
If you want to go that route, you would likely have to contact them
and give them a verbal release for me to get it.

Good afternoon:

I have left a message with Mr. Verhage to this regard as well....
Please be advised that I have been monitoring your email string, and
several concerns have arisen:

1. Our center closes at 5pm, after which the equipment will be
locked in my office for safekeeping. Please come before 5pm.

2. Whomever arrives to accept the material should provide
identification and some documentation that they are authorized to
accept the material.

3. It appears from your correspondence that you are contemplating
action against the company for damage to your equipment. Please let
us know immediately if you intend to do so, keeping in mind that the
claim laws and standards in the state of Idaho will be applied to any
claim you levy against us, and that all burden of evidence will rest
upon the claimant in a tort.

Please contact me immediately to notify me when and who someone will
arrive to confiscate your equipment. You may either email me at
tmorgan@... or call 208-388-2055.

Thank you,
Todd Morgan Damage Claim Specialist Idaho Power

To all-

For the record
The comments referred to in Mr Morgan's note were made by me. Dan I'm certain they are not complete enough to glean intent. I gladly take responsibilty for my comments, and have a message in to Mr. Morgans VM ATT to clarify my communication. It is my understanding that any miss treatment that may be percieved with respect to harsh handling of equipment was done so on an individual basis by an individual. I want to assure everyone concerned that I have no problem with "Idaho Power" as an Entity, or it's policies.

Mr. Morgan, is my word through email enough? We're an informal
group.

> 3. It appears from your correspondence that you are contemplating
> action against the company for damage to your equipment. Please let
> us know immediately if you intend to do so, keeping in mind that the
> claim laws and standards in the state of Idaho will be applied to any

> upon the claimant in a tort.

There will be no claim for damage. Period. Does everyone
understand that? It is inappropriate to even think this.

Mr. Morgan, some of us are upset by the way the capsule was
thrown into the back of the truck. There may have been some
damage done by the handling of the equipment that could have
been avoided, but the damage is proabably insignificant compared
to the damage done by the inital landing.

I think a part of the problem was that we didn't get a chance to
explain to the lineman, who picked up the stuff, what the nature of
the equipment was. The electronics inside cost us about $1000.
When we launch capsules, we understand there is a risk we may
not be able to find the equipment again. So we are prepared to risk
losting equipment.

I hope this clears up some of the feelings within this group.

Paul

Topic: 1309 Message: 1325

I'm not sure, but thinking back over setting up the mag mounts in the am, factoring in sleepiness, I think the setup was: Since voice would be rcv and xmit, I made sure the 5/8 wip, in the middle of the Suburban's roof, went to voice (mobile). The dual band, since I was expecting the APRS setup to be primarily rcv, was half-way between the 5/8 wave and the front of the roof, and went to the APRS radio (HT).

1326. Recovery of Capsule

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-19 22:03:28 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 1326 Message: 1326

I just got off the phone with Mr. Morgan. Dan, Mike, and John are authorized to pick up the capsule from the Idaho Power's office on Five Mile and Franklin. You'll need to bring ID with you. We need to meet and look over the capsules. I want to determine what was damaged and what we'll need to replace. I hope to pull data from the Thermochrons tonight. With any luck, a sizable fraction of the equipment will be salvagable.

Mr. Morgan let me know that when the capsule landed, it tripped a feeder to parts of Caldwell. Those businesses not effected are on a different feeder.

We will look at launch procedures. I'm thinking we should move a launch location that will not let the capsule descend over a city, even if the prediction is for the capsule to overfly the city. There should be no problem ascending over a city, but at the predicted burst point, I want to make sure we're not predicted to parachute over a city.

Second change....
Since we won't be flying again until the 2002 campaign beginning in March, we will spend part of the winter looking at insurance. Some kind of liability insurance will protect us from accidents like this. This may mean we'll have to become a non-profit. How ever it works out, I'll document it in my book. How would people feel sharing the cost of insurance? What if we have 5 people and the cost of insurance is $400 per year?

John, can you contact ARRL? Since we're heavily dependent on amateur radio, we may be able to get insurance through them if we create a radio club to do this. I'm not worried about equipment insurance, only liability insurance. By not insuring the equipment, we should be able to save money.

Any inputs?

I also think we should get a thank you for Idaho Power. Perhaps they'd be interested in a copy of a video taken from near space.

Paul

Thank you for your reply. We will look forward to releasing the equipment this afternoon. We apologize for any perceived mishandling of your equipment, I have interviewed our crews, and they were attempting to follow their immediate directives, which are to ensure safety, which they felt was becoming more and more compromised with the amount of people surrounding the area and the arrival of the news crew, and to restore service to our customers.

Good luck in retrieving your data and in future flights. It is still my suggestion you look into some sort of insurance coverage in anticipation of unexpected results from a flight such as this.

If you have any questions, you may contact me at 388-2055.

As I recall, at launch site I was reading the data from Paul's capsule as valid up to GPSLL and after that was a string of commas: ,,,,,,. That would tie in with the comment about corrupt data from Dave, I think. It's as if the GPS wasn't hooked up and there was no default info for the transmission.

However, that said, my QTH log shows 100 from KD4STH-11, 20 from KD7INN-11, and from our chase vehicle KD7MJC-11. I think my QTH was set to only keep a limited number. If so, I'll have to fix that.

> Also, the best altitude that I have found in the log is 94016
> feet. Did
> anyone get anything else?

Highest I see in my mobile log is 91,059 feet. QTH log shows 93,373 feet.

Paul-

I just enjoyed a pleasant conversation with Todd Morgan.
He confirms that all is OK for me to pick up the Capsules.
I am enroute att.

Hi Paul,

Glad to hear that the capsule is coming home and that you are considering getting liability insurance. ARRL has the best price on liability insurance through a group liability plan, it costs $325.00 per year for a 1 million dollar policy. I checked all other sources for club insurance before going with the ARRL offering and no one else even came close, in fact, many companies would not insure amateur clubs at all. It's way past time for TVNSP to 'officially' exist and begin protecting everyone's assets from an unforseen event such as Saturday's landing.

Also, I feel that you guys did all possible to remove the possibility of the capsule landing in a city for this launch. Your pre-flight predictions, as I read them, had a perfectly acceptable projected landing zone. This event was not predictable and that is the purpose of insurance. Sorry if I offended anyone with my rants on the treatment you all recieved from the Idaho Power employee. It was a very bad week here dealing with jerks and hearing that you found one to deal with set me off. Again, I appologize.

This is mainly in response to Todd's message. I wanted to address his third issue at least informally. (and I hope nobody minds me speaking up on this even though I'm a relative newbie)

I think everyone is glad to see the equipment being returned to its rightful owners and the situation being handled reasonably at this point. The concern was that the situation was handled very poorly by one individual representing your company on the scene. I think we all recognize that sometimes individuals don't handle situations in the way that their employer would wish.

A couple of comments:
If Darigold does cause problems for your company I think there are several of us who observed the recycler right under the lines in question using his can recycler which receives power from that line. I believe we also got the name of the guy from the recycler. He did state that he paid $25000 to get that line in to feed his can crusher.

I had my 8 year old daughter with me. She was quite upset by the actions of your employee. (Both by the fact that he was taking the equipment and by his treatment of it.) Not exactly the image one wants to project to the public.

Does your company have a policy on this type of event? I think we were all surprised by the way it was handled. At no point did your representative attempt to make contact with any of the individuals who were clearly interested in the outcome. I suspect that most of us figured that he would come talk to us when he was ready and that there was nothing to be gained by bugging him. The recycling guys and several individuals from Darigold had no problem figuring out whose equipment was on the power line.

A side note here: Your employee could have inadvertently caused an FCC violation by confiscating that equipment. He did eventually allow the equipment to be turned off, but had he not that would have been a violation since he (likely) does not hold the appropriate FCC license for the gear that was under his control.

To wrap this up:
What things should we do if we are unfortunate enough to be in this situation again? (The balloon payload did not land where predicted.) We had someone call your company right away and we remained on the scene to assist in any way we could.

What things can we do in the construction of our equipment to minimize the risk? Obviously, we haven't been able to inspect the equipment but from standing there watching it looked to me like the main problem was the additional wind loading was pulling the lines close enough to arc occasionally. It did not look like the capsule or its connecting lines was actually causing the short.

I'd hope that your company will work to enhance their field representative's dealings with the public, but I don't think you need to detail that here.

I'm sure you would be welcome to attend a meeting if you would like to present ideas on how to better protect both our equipment and yours. (Meetings are scheduled as needed, so just pipe up.) Of course, if you want to come participate in the "poor man's space program" you would be welcome there too.

One possible way of ensuring this would be to switch parachutes from the round one to one that we could control, i.e. a paraglide type. Kurt Larson, AC7ME, and I had a lengthy discussion about this. One possibility is to include a microchip who's function is to control the shrouds and have built-in landing parameters. Feed this from the GPS and we'd have one that was possibly self-controlled to come in more closely to where we want it to and if we added a radio receiver, one that we could take last minute control over to direct it away from any obstructions like trees, lakes, or power lines, if we gained visual sight of the landing zone in time.

This would add a little weight, but would also provide a wealth of control, IMHO. It might be something that we should consider moving towards, say for 2003?

I don't know how much I can contribute, but what I can, I will. Perhaps if this could be spread out over the year via monthly "dues" it would be more papatable?

> I also think we should get a thank you for Idaho Power. Perhaps

First reaction was "Why?" However, reflection on the situation reminded me it was an individual that was the cause of our frustrations, not Idaho Power itself. Idaho Power has been helpful in the resolution and recovery of our gear, so I would agree with this thank you thought.

Let me extrend an invitation to anyone at Idaho Power to attend a meeting and launch. I also think we owe them an appogy. I'll put a letter together for everyone to sign.

We should write down numbers for both Idaho Power and the telephone company. We should also learn how to determine which line is which. This way we can call the right people immediately, should this happen again, and get it resolved ASAP.

This has been discussed. We plan on working on a NSRV (near space return vehicle) for future flights. This reduces the amount of driving we have to do. It's definitely on the burner. In fact, we'll move it up a burner.

> > This may mean we'll have to become a non-profit. How ever it

Or charging dues like the radio clubs do. If we can get the $350 insurance form ARRL and spread it out among ten people, that would mean we charge $35 memberhip fees. Now, if someone doesn't pay, do we prevent them from participating in a launch? We really need to encourage as much help with launches as possible. right now it takes 45 to 60 minutes to launch. With enough trained people we could proabaly make that 30 minutes.

Does ARRL give the insurance if members are not members of ARRL?

Also, what do you get for your $35? We should proably have a newsletter. I suppose another benefit is that your participation is insured should an accident occur.

If we set up as a non-profit club, does this help get donations? A flight costs around $175. I believe we need a lawyer to help with the paperwork. Also, I believe three people need to sign as "founders" to form a non-profit.

Paul

1340. Insurance

Yahoo group: tvnsp (2000 — 2002)

Topic: 1340 Message: 1340

Project: Traveler has had $1M liability from the beginning, but it was a rough road to find it. Here's our experience:

- Insurance companies have a set minimum charge that they have to get for a policy (it has a fancy name but I can't think of it). Generally this is $400-$500 for specialized or medium-risk policies in Kansas.

- All of the larger companies that we spoke to either didn't want to touch us or put us in this medium risk group. We finally found smaller office that agreed to insure us.

- When we explained to them what we needed, they asked if we had an official club organized to participate in these outings, and we explained that Project: Traveler was a part of our local ham radio club. They then suggested that we get a general insurance coverage for the club, and that it would cover club events (i.e. ballooning). They assured me that the coverage would extend to club property and any damages that it causes.

- The total liability premium was $250 for last year.

It seems like the smaller companies are more willing to work with you and be creative. We also had some networking going with the agent which certainly helped and added to our credibility. Our agent is:

Joe McGuire Insurance
Hutchinson, KS
620-662-6674

I'm pretty sure they're not licensed for Idaho (just Kansas and a small number of states) but they may be of some help for you to find someone in that area. My advice is to get some insurance - I know that we sleep a lot better at night. Just be up front with the company on what you're doing but ask for a club event policy.

Oh yeah, and ARRL really didn't know what ballooning was, but was pretty sure they didn't want to cover us for it.. :-/

1342. Fw: Paragliding wing

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-20 01:30:27 UTC
From: Zack Clobes
Topic: 1342 Message: 1342

I have been looking into the paragliding wing idea for a while now. This email came from a manufacturer of R/C para-planes.

Forget about using a paraglider in those winds. It will collapse and go into convulsions. You will need to use something rigid. Sorry

Subject: Re: Paragliding wing

We have a number of issues to work out with the system but have a couple of pressing questions to get figured out:

How much of a pull would be required to steer the wing? Do standard servos with their 3/4 inch of movement pull enough?

You mention problems with wind - what types of problems? The air currents that high are moving at 40-100+mph, but so is the capsule.

Is there information on the web regarding the packing and deployment of a chute?

What would you charge for just a wing capable of landing 6 pounds?

Thanks,
Zack Clobes, W0ZC

yeah it would work. you would have to rig up your own steering system though. They steer using brake lines that pull the trailing edges of the wing. That altitude may cause turbulence problems also, these things dont like wind.

Subject: Paragliding wing

I'm interested in dropping a small package from 60,000 to 90,000 feet and would like a paraglider wing to allow me to steer the package. The entire capsule weight including the parasail would have to weigh in less than 6 pounds. Would one of your wings work for this type of application or do you know where I could get one? Also, what is involved with steering a wing such as yours?

Thanks,
Zack Clobes

1343. Equipment accounted for-

Yahoo group: tvnsp (2000 — 2002)

From: paulson58@juno.com
Topic: 1343 Message: 1343

To all-

I am with Jeff as we speak. The equipment is in his truck all bagged up.

I had a good conversation with Todd Morgan at the time it was picked up. He is interested in our work, and is anxious to get a copy of the flight video. We will oblige him. Some time was spent talking about our purpose, education, Ham Radio Etc. He represents Idaho Power in what should really be considered the last word on this particular subject. He was invited to the next meeting. Turns out He's an Amateur Astronomer. He thanked us Kindly. We thanked him kindly. All is OK. Paul and Jeff will be providing us with updates on Data accumulated.
As far as Todd is concerned, he was happy we got our gear back and wished us all the success possible in our future efforts. He said we are squared away with respect to them.

Please let me suggest an alternative to forming a new radio club. I believe it is possible to have the VOI club sponsor the balloon program. It already has the insurance to cover all members in club sponsored activities. A good number of us are already members. The cost to join is $20. per calendar year and includes a newsletter. In the past there have been those in the club that thought ballooning was not an activity the club should sponsor. They are in the vast minority!
I have been nominated as a candidate for President. I will make it known my intent to have the club sponsor the "high altitude balloon" project. There would be a budget for costs, such as gas, balloons, and equipment. If we gain a number of members, it would help defray the costs of the budget. The insurance is already built into the budget and would not be affected.
I think it would be a good option. I am sure there would be some details that would need to be worked out but I don't see any problems.

Your thoughts, please.

From: K7JPS - John
Topic: 1326 Message: 1346

By joining an established group we avoid the extensive process of having to set up the administration of a new group.

In a previous e-mail Zack Clobes said that ARRL was not interested in insuring his balloon group, but that may have been because the primary focus of the club was ballooning. I would like to know if the balloon activities would compromise the insurance of VOI.

On a similar topic, My December 2001 issue of QST which arrived today had an article on page 86 about Non-Part 97 Rules which affect Hams, one of the topics was the Volunteer Protection Act of 1997. If the organization has IRS Section 501(c)(3) status the Act provides a defense to "frivolous, arbitrary, or capricious" lawsuits filed against individual volunteers. Part of the conditions to qualify for this defense include "The harm was not caused by willful or criminal misconduct, gross negligence, reckless misconduct or conscious, flagrant indifference to the rights or safety of the individual harmed." It does not mean that the individual can not be sued, it is just a defense against the suit. I am not sure on the legal definition of a volunteer, if this includes due paying members of an organization or not. This act protects the volunteer, but not the organization. This is something that I would like to research however we formalize TVNSP.

How would people feel sharing the cost of insurance? What if we have 5 people and the cost of insurance is $400 per year?

John, can you contact ARRL? Since we're heavily dependent on amateur radio, we may be able to get insurance through them if we create a radio club to do this. I'm not worried about equipment insurance, only liability insurance. By not insuring the equipment, we should be able to save money.

Any inputs?

I also think we should get a thank you for Idaho Power. Perhaps they'd be interested in a copy of a video taken from near space.

So, inquiring minds want to know - how's it look. We know at least some of the equipment survived the poor landing spot. Does it look like anything (besides the outside of the capsule) got fried?

Did the video tapes survive being in an AC magnetic field?

>As far as Todd is concerned, he was happy we got our gear back and

1349. Meeting and others? from Paul

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-20 05:25:15 UTC
From: Jeff Melanson
Topic: 1349 Message: 1349

We have the capsule back. Jeff's capsule is fine, mine is mostly toast. I have a nunber of items that survived and will fly again.

We need to meet soon to discuss issues of insurance and forming a club. Will Friday work? I'm thinking of an eating meeting, like our prelaunch dinners. Where would everyone like to meet? Time?

I want to thank Idaho Power for their support. The equipment was protected at their yard. There was no damage from them after it was brought down. Thanks again.

I have some pictures from the capsule to print. Would anyone like copies? I'll have them printed tomorrow.

We have some nice video. We'll make copies for those interested. When the balloon was cut away, the image quality was fantastic. Usually the balloon yanks the capsule all over the place. But once the balloon is cut away, its real smooth sailing.

Begin searching for insurance, please. This will be very important for us this winter.

Future experiments will involve paragliders. We'll run some tethered balloon tests before we actually launch one. I'm also planning for us to attend a balloon launch by the NWS. I also want to get video of water (dyed red) boiling in near space. Another test is for a despun section. First though, I think we need to make a sun sensor.

I'll put together a pamplet on what is near space in the next few days. Patches, we need to find a source for patches.

As far as launching, we need to look at modifying our procedures. Jeff , the two Johns, and I were discussing a cutdown for the lanyards, rather than running the lanyards through a pulley. I imagine we should get hard hats for launch crews. I'll pick up some lab jackets. The hard hats are for protection while the lab coats are to look cool.

Paul

I will make anytime this week -- outside of Turkey Time Thursday -- work for a meeting. Also, count me in for the NWS field trip. I would like copies of photos and video, I have some blank video tapes that I can provide.

I have looked at ARRL insurance (see my last post) if we set up TVNSP independently of VOI then we have to be ARRL affiliated to qualify for their insurance, and I would like to read the fine print to see how it pertains to unmanned - ballooning since they do mention an aircraft exclusion. One thing that this insurance would cover would be the $1,000,000 that I think Boise Town Square wanted for us to set up a display in the mall.

I would like a copy of the video and pictures Paul. I will pay for my cost of a VHS tape and picture developing at the next constuction meeting.

As for a meeting, I can't make it on Friday, work night for me. I am in support of making our own club, and although it would be easier to fall under the umbrella of VOI for this, I think it would be a lot less complicated by outside sources to be on our own. I am a VOI club member, and I can predict some concern from the members of the club on liability issues, especially after this weekends excitement.....just my 2 1/2 cents. I will support and uphold any decisions made concerning the formation of the club.

I would like to volunteer to be named to the position, "Keeper of the Noble Gas" :)

I understand some of this but not all. Anyone else feel free to jump in.

Like Jeff says above, There is a massive surge in current through the lines that creates an Electromagnetic field. The field, for a moment, is Huge. If you could see it on a scope it would look like a Huge spike. Off the scale. It can travel a long ways on the lines, but it depends what is around. In this case, we witnessed a second arc that occurred a half second or so after the first. I'm sure the spike was long gone by then, but it was so strong, it got the mass of cable in motion pretty good. They were only moving at his time because their mass had inertia. The cables had enough slack at this spot to touch, so they did. The second Arc occurred. Several things can eat up the spike. One is Transformers. The primary of those high voltage transformers on the next pole have large and stable electromagnetic fields. This acts like a choke coil and readily absorbs the spike. The spike was big, but very short in duration. The primary voltage of the coil may have just bumped up a tic or so for a micro second. Hardly enough to see on an analog voltmeter. Also, The spike is seen by Modern Power company equipment. (I don't remember what its called.) It will pull power away very quickly from the lines if it see's a spike, short, open, who knows all what. It will then try to re-apply power a second or so later. If the offending issue is still there, it will shut off again. I don't know if it keeps doing this. The momentary open in the line gives the spike no travel path. That will stop it as well. Not much reflects back from the open and what does gets absorbed quickly by the reappearance of the normal voltage and it's associated Electromagnetic field. In another place, we may not even see the second arc. This happened at that location due to several factors. This was size of cable, size of spike, length of span, amount of slack, distance between cables etc. You may be out in

the boonies and see it happen, No transformers around, and as far as you can see down the line, the spans are in motion. More motion where the short occured, getting less and less as the distance increases. The spike will lose it's power as it slowly gets absorbed in the smaller magnetic field created along the power line.

1353. What a video! and other stuff.

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-20 07:40:19 UTC
From: Jeff Melanson
Topic: 1353 Message: 1353

Hi all,

Paul and Dan and I have watched the video. It is the first full length video from launch to landing that went to 94,081 ft. The thicker skinned balloon allowed the higher altitude. Normally we would have expected 85,000 ft. I will start making copies but be patient. It takes time to make as many copies as needed. I will bring it to the meeting. I do need a little help with donations of blank video tapes. We want to make copies for other interested parties. I want to send a copy to Mark Conner and Ralph Wallio. Mark, the cloud layers are absolutely beautiful. I would like you to digitize some of the scenes so we can post them to the website if it's not to much trouble. I would also like to make a copy for Todd Morgan with Idaho Power who expressed an interest in what we are doing. There was someone else at the landing site with one of the local businesses that wanted a copy. Does someone have his name? The beads in front of the camera did get darker as altitude increased but only to a certain point.
The thermochron in my capsule showed the temperature decreased to 17 degrees Fahrenheit. Paul will be analyzing all the data over the next few days and I'm sure he'll post it as he gets it. The pager did not record any phone calls to it. The string that held the glider was not cut. The first call made to the pager was at 50,000 ft. That means that reception was not improved by adding the external antenna. I suppose there could be other reasons. I think we should look at systems that don't rely on other services such as a pager service.
Okay, here's the scoop on my viewfinder. As some of you know my viewfinder failed on a previous flight that went to 85,000 ft. It is believed that high voltage arcing may have occurred due to the low pressure at high altitudes as Ralph Wallio explained. This flight went to 94,000 ft. The results? The view finder is working however it is degraded. The black and white image is not as crispy clear as it normally is. Once again the video recording was not affected and the LCD display works great. Ralph, do you suppose that if I unplug the tiny little CRT tube that high voltage arcing would not occur on the circuit board?
Dan has made some good video with his camcorder showing the launch and chase. Paul wants to produce a video that shows what balloon groups do. He wants to work on that this winter.
We have lots to do this winter. I would like to encourage everyone to come to the construction meetings and start putting your own capsules together.

Meetings are the 2nd Wednesday of the month at Idaho Pizza Co. in Meridian, start time is 7:30pm. Check out the VOI web site for details and a map. http://www.voiceofidaho.org/

Jeff, count me in on supplying some tapes, similar to what I did last launch. Also, I would be interested in the photos as well. If you are at the Friday night meeting I will give the tapes to you then.

Thanks for all the hard work in copying the tapes.

I too like Doug's suggestion. I was under the understanding the VOI was not interested in ballooning. As a life member of VOI am glad to hear that was incorrect. Sounds like the best plan yet.

All-

This was incredible viewing. The sights and sounds captured
are awesome. The descent from the Balloon pop even showed much
of the Balloon on the Haul line right in front of the Camera.
You couldn't make it do that if you wanted. You can tell
exactly where the timer cutaway device at the Chute Apex
operated. It changes the Stack pitch angle. Great stuff.

I too will make copies of the Launch from the ground. Unlike
Jeff's Video which can and should be made seamless, I can and should
edit. Mine shows great How to's at the launch site and the thrill
of the Chase alll the way to a short, but good shot of the
Stack under Canopy as it makes it's final descent and disappears
behind the Signs and buildings. Mine sadly has a lot of
shots of my shoes as I move from one spot to another, the
world buncing by till your Sea sick, and some great Blurry
stuff inside the Truck. (I got no idea what I was doing)

I wll also be needing tapes.

Dan

Were talking burnt crispy toast! some of the chips have the plastic
blown right off the surface!

> We need to meet soon to discuss issues of insurance and forming a club.
> Will Friday work? I'm thinking of an eating meeting, like our prelaunch
> dinners. Where would everyone like to meet? Time?

Something besides pizza but should still be in the Nampa-Caldwell area.
Suggestions? How about 6:00 pm?

> I have some pictures from the capsule to print. Would anyone like
> copies? I'll have them printed tomorrow.

I've already let Paul know I want a copy. Some of the pictures should
show the drop zond release.

> We have some nice video. We'll make copies for those interested. When
> the balloon was cut away, the image quality was fantastic. Usually the
> balloon yanks the capsule all over the place. But once the balloon is
> cut away, its real smooth sailing.

The best video yet. Bring some blanks to the meeting. Paul will bring me
his VCR and I'll start making copies. I'll have one with me to show at
the meeting.

> Begin searching for insurance, please. This will be very important for
> us this winter.

I am stating for the record that I won't fly (float) again without
liabilty insurance.

> Future experiments will involve paragliders. We'll run some tethered
> balloon tests before we actually launch one.

I have a small paraglider that Dan obtained. It won't carry our payloads
but we can run test's with it and study it's construction. I'll bring it
to the meeting. Check out this website that Zack Clobes brought to our
attention. It explains how they work.

http://www.powerglider.com/faqs.htm

> I'm also planning for us to attend a balloon launch by the NWS.

New People: Don't miss this! I went to the last one, it's very
educational.

> I also want to get video of water (dyed red) boiling in near space.

Anyone else have science experiment suggestions for future missions?
Ralph Wallio suggested one involving High Voltage arcing in near space.
The lower air pressure will greatly affect the ablility to jump a gap.
Anyone want to design that one? By the way for you newcomers here is
Ralph's wesite. He tracks records set by various mission.

http://users.crosspaths.net/~wallio/

> Another test is for a despun section. First though, I think we need to make > a sun
sensor.

The goal here is to take the spin out of the capsule to get good
photography. If a camera is held still with the lens help open long
enough we can get pictures of stars. Who will be the first!

> I'll put together a pamplet on what is near space in the next few days.
> Patches, we need to find a source for patches.

Paul defines Near Space as starting at 75,000 ft. What do you think? I
would like to see our logo made into a patch that can be sewn on the
front of a ballcap or on a jacket. Perhaps we can exchange patches with
other groups if they make some. We'll start a collection!

> As far as launching, we need to look at modifying our procedures. Jeff
> , the two Johns, and I were discussing a cutdown for the lanyards,
> rather than running the lanyards through a pulley. I imagine we should
> get hard hats for launch crews. I'll pick up some lab jackets. The
> hard hats are for protection while the lab coats are to look cool.

During our launch one of the lanyards got caught on the ring and Mike
had to let it go with the balloon. That was a good move. It probably
prevented a disaster! We'll need a new kite winder!

Another thing that we will be addressing is launching from locations
that prevent the capsules from coming down in populated areas. It might
mean recovery's that are more difficult. It just adds to the fun and
makes good stories. The paraglider concept should help with recovery.

I'm thrilled to hear how this bumpy TVNSP event is turning
out after that dismal Saturday afternoon.

The videos sound wonderful, and this group and this list
are FANTASTIC! Really, the spirit of cooperation among
TVNSP members is quite impressive. I have to add that
even though I'm a big balloon enthusiast, I don't gush
too much with compliments ordinarily.

I'd like to post permanently some very choice bits of
flight video to the AMSAT balloon page if a digital movie
file can be provided by TVNSP. Someone please email
me in the next few days about the mechanics of getting the
file created and uploaded. I'll check with AMSAT about
how much space could be made available as far as megabytes,
and if there's a preference about what image format.

Lastly, keep those still and movie images coming!!, because
this is the way to get ballooning on the map, and "sold"
to clubs and hams lukewarm or cool to ballooning and
the general "technical" side of ham radio. (I know,
ballooning doesn't have to be all technical).

Hank

If anyone is interested, Target has a video 12 pak for $10.00. Jeff, I will buy one and bring it to the meeting Friday. It is yours. One question: can you make several tapes at the same time? If so, I will loan you a recorder for making tapes.

Please take plenty of still pictures of the damage, inside
and out. Too bad there weren't two miracles and no capsule
got blasted, but this TVNSP filed testing regimen is very
severe -- way in excess of UL requirements. :)

Hank

1364. Re: [tvnsp] Meeting and others? from Paul

Yahoo group: tvnsp (2000 — 2002)

That's a good price for tapes.

When Paul brings his TV/VCR over I am going to hook things up like this: The camcorder will feed video to my TV/VCR. The output of my TV/VCR will feed video to Paul's TV/VCR. This makes two copies at once. This is how I made some of the last copy's. The video quality was good. It was recorded and played at standard speed. This new video is recorded at LP (longplay = 4 hrs) speed. I will check the video quality. I don't know if I can chain more recorders together and maintain quality. I'm not a video expert. Perhaps someone else can help with this technical question.

> severe -- way in excess of UL requirements. :)

That was supposed to be *field* testing.

I'd of course like a tape, and I was going to
mail a bulk pack of at least six as a donation,
but suppose it would be more cost effective to
send cash and avoid needless shipping charges.

I'd encourage TVNSP list subscribers outside of
the Boise area to consider doing the same, if that
could be managed.

Is there a person who could be designated as the
receiver of such donations expressly related to
the tape? And who could do the mailing out of
tapes?

Bubble padded packages widely available now at
retail should be adequate protection for shipping.

Hank

How do you like your toast?

Paul, we forgot to take pictures last night. Do you have a camera? If not then perhaps you can bring it to the meeting and someone can bring a digital camera.

There's a Harbor Freight in Boise on Fairview. I recommend a
DMM when working on the CC/PS.

Mark Conner made a video of the landing of the last flight...

14.5 Mb MPEG:
http://www.n9xtn.101main.com/tv01g-landing.mpg

1.5 Mb RealVideo:
http://www.n9xtn.101main.com/tv01g-landing.rm

He might want to make a video clip of this flight but first we have to
get a copy made and mailed to him. I have no idea how much trouble it is
to make this. Does anyone else have this capability? Paul will sometime
this winter but hasn't set up his equipment yet.

I went to the web site listed below, found the Multimeter for $4.99. Click on "Add to Basket", the price comes up at $49,900.00. A little steep for my credit card. I didn't go any further.

Subject: Re: [tvnsp] Recovery of Capsule

Please let me suggest an alternative to forming a new radio club. I believe it is possible to have the VOI club sponsor the balloon program. It already has the insurance to cover all members in club sponsored activities. A good number of us are already members. The cost to join is $20. per calendar year and includes a newsletter. In the past there have been those in the club that thought ballooning was not an activity the club should sponsor. They are in the vast minority!
I have been nominated as a candidate for President. I will make it known my intent to have the club sponsor the "high altitude balloon" project. There would be a budget for costs, such as gas, balloons, and equipment. If we gain a number of members, it would help defray the costs of the budget. The insurance is already built into the budget and would not be affected.
I think it would be a good option. I am sure there would be some details that would need to be worked out but I don't see any problems.

Your thoughts, please.

Doug KD6GCL

At 03:03 PM 11/19/01 -0700, verhap@... wrote:

I just got off the phone with Mr. Morgan. Dan, Mike, and John are authorized to pick up the capsule from the Idaho Power's office on Five Mile and Franklin. You'll need to bring ID with you. We need to meet and look over the capsules. I want to determine what was damaged and what we'll need to replace. I hope to pull data from the Thermochrons tonight. With any luck, a sizable fraction of the equipment will be salvagable.

Mr. Morgan let me know that when the capsule landed, it tripped a feeder to parts of Caldwell. Those businesses not effected are on a different feeder.

We will look at launch procedures. I'm thinking we should move a launch location that will not let the capsule descend over a city, even if the prediction is for the capsule to overfly the city. There should be no problem ascending over a city, but at the predicted

burst point, I want to make sure we're not predicted to parachute over a city.

Second change....
Since we won't be flying again until the 2002 campaign beginning in March, we will spend part of the winter looking at insurance. Some kind of liability insurance will protect us from accidents like this. This may mean we'll have to become a non-profit. How ever it works out, I'll document it in my book. How would people feel sharing the cost of insurance? What if we have 5 people and the cost of insurance is $400 per year?

John, can you contact ARRL? Since we're heavily dependent on amateur radio, we may be able to get insurance through them if we create a radio club to do this. I'm not worried about equipment insurance, only liability insurance. By not insuring the equipment, we should be able to save money.

Any inputs?

I also think we should get a thank you for Idaho Power. Perhaps they'd be interested in a copy of a video taken from near space.

Paul

I'll be glad to try to attend the meeting this week, provided it's not on Turkey Day.

I'd like to see the pictures, but don't need copies of them, at least not at this moment.

I'm definitely interested in a copy of the video. How can I help defray the costs of copying? Bring some blanks to the meeting, drop them off somewhere, contribute to the cost of the blank tapes used, or...?

Can you detail this a bit more? Does the gap become easier or harder to jump as you go up? What should be used for electrodes? How far do you want the gaps to move? We don't have to pull apart our favorite Jacobs Ladders for high voltage caps and coils do we?

I'll get a low current air ionizer circuit through a surplus magazine.
The terminals are just wires. I'll glue them to a plastic servo horn.
The flight computer (CC/PS) will cycle the servos every one to two
thousand feet. All I have to do is detect when the current begins to
flow.

As the balloon ascends and the air pressure drops, it should be
easier for the electrons to jump the gap between the electrodes.
When that happens, you get a spark across the gap.

Paul "spark gap between the ears" Verhage

Jeff,Dan and Paul

I would like copies of both video's and snapshots. (they sound priceless)
I cannot make the meeting Friday due our annual club "coffee break" function this holiday weekend. It would be great to have a video to show visitors on their travels,but that is probably not possible this time.
I will make good on tapes and funds where needed.

Also check my logs, i showed 94,142 feet. Every foot counts when great balloonists strive for perfection.

What an exciting launch i had to miss. Nothing like breaking in "newbies" with spectacular feats of daring. (tongue firmly in cheek ready to swallow.) Sounds like we have a bunch of new and talented members getting involved with the group.

Also,i am in agreement on needing insurance. I have been a little nervous about this anyway. Whatever the majority decides, i will go along with it.
Any of the mentioned ideas presented so far i can live with.

Jeff wrote:
Paul and Dan and I have watched the video. It is the first full length video from launch to landing that went to 94,081 ft. The thicker skinned balloon allowed the higher altitude. Normally we would have expected.....

Another benefit of be apart of the VOI. Web space is free. You could get a domain but there is ongoing expenses involved. You could spend your money on real balloon stuff like gas and balloons rather than Internet costs. A domain name does not cost much but to have it hosted does. I have no stake in the current site. You, of course, can do what you want. You could even get the domain and have it point to the balloon section of the VOI site. I just think any extra money spent might best go to balloon hardware.

1393. Good news, sounds like

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-21 03:43:43 UTC
From: Mark Conner
Topic: 1393 Message: 1393

Glad to hear many things were resolved with Idaho Power. With my own flight, I was fortunate to have understanding crews responding. This was though I pulled one guy off his tree-trimming job on a Saturday. They were very professional throughout, and took extra care to recover my camera intact, though I told them to just knock it off the wire if that was easier/safer.

I'm in Indiana this week for Thanksgiving, so I'm a little slow on the e-mail. Yes, I'd like a videotape, and it's not much effort to make a clip for a web server and I'm happy to do it. I owe Paul for a couple of boards, so I'll add some more for another tape coming this way. If TVNSP is going to have its own domain and web space, then you may want the clips stored there as my uptime and bandwidth are not the best (the same machine that has the clips is my APRSPlus I-gate at home).

I'm also interested to hear about your efforts on insurance. If this can be covered under the ARRL club liability insurance, I may go that route if the club I belong to agrees.

> > our prelaunch
> > dinners. Where would everyone like to meet? Time?

Friday is doable. Idaho Pizza's fine with me, but if you guys are tired of pizza elsewhere is ok too. (I may have kids in tow, so kid-friendly is a plus, but not essential.) Please keep me posted. I'm also updating Bill B.

> > I want to thank Idaho Power for their support.

Speaking of Idaho Power... Did anyone notify KTRV that the equipment had been returned? If not, we should be sure to do that.
BTW for Todd - They didn't arrive till after your crew left.

> > I have some pictures from the capsule to print. Would anyone like
> > copies? I'll have them printed tomorrow.

I'm definitely interested in seeing them, but don't necessarily need a copy of them all right now. I wouldn't mind a copy of 2-3 really good ones though. I trust Paul's judgement on that.

>We have some nice video. We'll make copies for those interested. When
>the balloon was cut away, the image quality was fantastic.

Cool - I would definitely like a copy of that. I'll bring some blank tapes. I owe you one anyway for the TV01G tape. I'd like to get a copy of the flight tape and the instructional tape. (Edited version just fine)

>I'm also planning for us to attend a balloon launch by the NWS.

Sounds interesting.

>I also want to get video of water (dyed red) boiling in near
>space. Another test is for a despun section. First though, I think we
>need to make a sun sensor.

Sounds like some good ideas. I think the sun sensor could be relatively simple. I've got one of the old Heathkit robots and it is able to locate a light source just by the different illumination level even in a brightly lit room. We might have to use some type of filter to scale the available light to avoid swamping the sensor.

>Patches, we need to find a source for patches.

I'll ask a buddy who used to own a souvenir sports store. He'll know where to get them. I'm going to try and drag him along anyway. <grin>

>As far as launching, we need to look at modifying our procedures. Jeff,
>the two Johns, and I were discussing a cutdown for the lanyards, rather
>than running the lanyards through a pulley.

I've got a working idea how to do that. I'll try to draw up a sketch before Friday. I figured out a way to permit releasing one lanyard and then the other that seems pretty simple.

>I imagine we should get hard hats for launch crews. I'll pick up some lab
>jackets. The hard hats are for protection while the lab coats are to look
>cool.

LOL - You'll need to get the hard hats dirty or you'll look like managers or scientists. <grin> If you don't mind mine looking well-used I can supply my own. It'll be an interesting mix of technology. I volunteer at the restoration of an old railroad and work on a steam engine that was built in 1915. (See http://www.svry.com)

Bill

p.s. Please excuse the double quote marks in places. Micron is blocking Boise School District so I don't receive any messages from Paul direct.

>I made some of the last copy's.

Hmmm, it might be worth trying a splitter on the output of the "main" vcr. That way you don't have the second VCR amplifying for the third. (Might be better, might be worse.)

>The video quality was good. It was recorded and played at standard speed.

I'd definitely use the slowest (shortest play time) speed you can get away with. The quality is far better.

>I don't know if I can chain more recorders together and maintain quality.

I'm sure there is a limit, but I'm not sure what it is. It seems like I've heard of at least one video outfit here in town. I wonder what they would charge to do the copies. Another option might be one of the TV Stations if anybody has connections there....

I agree. I'm willing to contribute to that cause. I've already got a
contact record set up if needed.

Doug - can a domain be pointed at the current location? (or VOI if we go
that route?) I know the place where I host pages for some non-profits
allows setting up sub-domains that point at a sub-directory for a much
lower fee than full-blown hosting. If we do end up looking for a place to
host it I will offer space at my cost. (I resell 2 non-profit groups space
under the third so that I get a lower price overall.) However, Doug's right
- I'd rather see the money go to balloon flights than page hosting if possible.

Near the corner of Fairview and Eagle is the Texas Road House.
It's a bit noisy, but they have good eats. Would anyone be
interested in meeting there on Friday?

At this meeting we'll discuss club plans, insurance research, and
webpages.

For now let's leave the email group open to discussions on
planning future experiments, launch procedures, and publicity.

I plan to shoot more CC/PS (flight computer) boards this weekend.
For our meeting on the first Sunday in December, I'd like to work
on parachutes. Who is ready to cut?

If there's only a few people who will be making parachutes, then I'd
like to get more capsules built. For this you need 3/4" styrofoam
sheets. A 4' by 8' sheet from Home Depot will build a small fleet.
If Bill can line us up with patches, I'd like to sew some onto the
abrasion jackets of the capsules. I'd like to see us keep to a
uniform design so that we can easily integrate everyone's capsules
into a near space stack.

After a couple of capsules are put together, I'd like to get everyone
trained on the Basic Stamp.

Two new terminology terms....
A fast ascent rate can be referred to as a hot launch.

Once the balloon reaches an altitude above 75,000 feet, is it on
station. NASA says a Shuttle is on station once it arrives in orbit.

I'd like to design an aurora flight that could be launched on a one
day's notice. That design should keep us busy for a while. If
anyone feels like they're not busy, I can find something for you
(don't I sound like a teacher?).

I made six sets of photos last night. The total cost was $21.50, so divide that by six for your cost.

Many photos are of the ground before launch. I'm wondering if the capsule thought it was in descent mode.

There is one photo of the Dropzond. The location is over the barren deserts of Oregon. We have some photos of clouds. Most of the pictures are pretty bland (sort of like Oregon). there is a total of 25 pictures, so the camera worked as it suppose to.

After you start building airframes, I need to get the group modifying their own cameras and building scan platforms for them.

Paul

The Texas Road house is extremely busy on Friday
nights. The place around there looks like a zoo. If we
are having equipment at the meeting then I would
suggest a place that is fairly quiet. One place is the
Jade Garden on Nampa-Caldwell Blvd. It also has a back
room that would help us keep things out of the way of
other people.

My two cents worth.

Hmmmm, Thats up to you. Maybe we should look for a similar but
slightly modified term. NASA's "On station" means they are at their
Target altitude.

> I'd like to design an aurora flight that could be launched on a one

Ummm, Mr. Teacher, can I go to the Bathroom?

What do you think about putting a few idea's into a different Flavor
of capsule. What I'm thinking of is based on your future plans. We
make a capsule who's purpose is to "Cause Orientation". This capsule
is designed to sit first under the Parachute. It has CDS photo cells
or whatever built into it for looking at the Sun. It's split or
somehow made to be motorized down through it's axis. Over simplified,
but a Lazy susan type design that is close loop motorized looking at
the photo cells as Error input sensors. We can add in and remove
magnetic orientation etc. Whatever powered maniacal ideas we can
conjure up. This would provide lateral flexibility in construction
weights on the stack, without effecting the other capsules in the
Stack. It would be the "Test bed" for motorized stabilization
platforms. I would be interested in working on such a capsule
provided it is deemed to have viability. Also provided some of you
great brains help me out.

As far as a despun section, I was thinking of a despun adapter. We could connect standard capsules above and below it. The despun section would have a sun sensor. Using feedback or a microcontroller, the section would rotate a motor, thereby keeping the lower capsule in the same sun orientation.

With the right splitter the limit is 'how many recorders can you
afford.' There is a place here in Twin Falls that can do 25 copies at a
time.

I'd like to get a copy of the video, and I think there might have been a
t-shirt on the night flight for me that I need to get too.

1416. Patches & Tape Duplication

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-22 03:46:13 UTC
From: Bill Herrmann
Topic: 1416 Message: 1416

For patches my buddy recommended that we talk to Carpenters Screen Printing in Caldwell. (They also do embroidery.) I did not call them since I'm sure the price is dependant on design, number of colors etc.

Several years ago the same buddy mentioned a family video tape that had had problems and the place he had found to fix it. He was impressed with their work. As I recall they're a little hard to find.

Anyway...
Custom Recordings & Sound
344-3535

I called them to find out about duplication, editing and the like.

For duplication - cost is time based - 2 Hours would be approximately $5/tape including the tape. (He can give a better estimate after reviewing the material to be copied.)

Editing for a master (I was thinking of the training video here) would be $50-75/Hr depending on equipment used. Of course, they can duplicate after that. Another possibility here is that the local high school has a video program. I can see if there is any possibility of them editing for us or letting us use the equipment. Too bad our high schooler took that last year!

The video place currently makes over 36,000 copies/month. Yikes!

Bill

Bill,

I'm already making copies. I don't mind and it's a lot cheaper cause I'm cheap. John Knapp is providing 10 tapes, Paul is providing 10 tapes, and I will provide 10 tapes. If more is needed I'll ask for more blanks. Dan is working on the chase tape. The idea is to edit video from that tape and flight tapes to show what we do. This might be a longer project to be done during the winter. We can talk about this on friday.

Paul will be here tomorrow for thanksgiving. I will see to it that he post's email on whether or not he was able to reserve the room at Jade Garden.

Hi Jeff,

It is very unlikely that I can make it as we have company but I will try. I would like a copy of the video also. I vote that we get insurance somehow, either through affiliation with VOI or by creating a non-profit organization. I also vote for dues to support the expense of the insurance and vote for no printed newsletter. Newletters are nothing but a headache and no one will stick with it. Our email keeps everyone posted well. Hope I can get there to voice some more of my opinions. Oh, by the way, did I tell you that opinions are like.....

;-)

Stephanie and Mike,

I printed you're emails and will make sure you are heard at the meeting.

Mike,

It looks like we may be joining VOI for insurance reasons. Paul needs to get a couple of insurance questions answered first but it looks good. Doug addressed our concerns with being part of a radio amateur radio club. More details later. If we join VOI they have unlimited webspace available through the service there using. We can use tvnsp.org and point it to the balloon section of the VOI server. Our current website is already at 9.3 MB.

Stephanie,

You are on the list for a copy of the video. If we join VOI (looks good
so far) then only the dues normally collected by VOI are required.
$20.00

Jeff

Let me try that again. It's late.
The dues collected by VOI is all that would be needed. No additional
dues would be necessary.

Stephanie

****

"They that can give up essential liberty to obtain a little temporary
safety deserve neither liberty nor safety."

Benjamin Franklin (1706-1790), Letter to Josiah Quincy, Sept. 11, 1773.

"Those who desire to give up freedom in order to gain security will not
have, nor do they deserve, either one."

President Thomas Jefferson.
1743-1826

****

Send and receive money safely over the Internet by using PayPal. I use it and highly
recommend it as a safe and reliable means to conduct business. By using the link
below we both will receive a $5 sign up bonus.

https://www.paypal.com/refer/pal=kc7dba%40arrl.net

1433. List of names for Videos

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-24 08:38:20 UTC
From: Jeff Melanson
Topic: 1433 Message: 1433

Hi all,

This is a list of names of all those who have asked for a copy of flight TV01H. In addition to the video there will be a time index sheet that tells you what time particular notable events occured. This makes it easy to find stuff. If your name or someone elses name has been missed please let me know.

Paul Verhage
Todd Morgan
Mark Conner
Ralph Wallio
Hank Riley
Lee Kelly
Rick Widmer
Dan Paulson
John Knapp
John Knapps Boss
John Stone
Justin Formolo
Bill Blohm
Bill Herrmann
Tim Rynearson
Mike Garske
Stephanie Steele
Randy Farley
Jeff Melanson
Discovery Science Center
Hobbytown
Manager of Jade Garden Restaruant - Danny Yip
(Where we ate tonight - he was very interested and supportive. He suggested we reserve the banquet room in the future which has a tape machine. We gave him a copy of the video. Thanks Danny)

1434. Re: [tvnsp] Tonights Meeting

Yahoo group: tvnsp (2000 — 2002)

From: Jeff Melanson
Topic: 1420 Message: 1434

Yes. Plenty. Besides Doug talking to us about the benefits of joining VOI. He cleared up a lot of questions.
We also decided to do a few other things.
- Make a mission statement that describes what we are about.
- Write guidelines for mishaps. For example we'll have one person representing the group to handle exchanging information etc.
- Write guidelines for capsule construction that promote safety.
- Prediction guidelines. The purpose here is to set up guidelines that make landing sites as safe as practical. For example we wont launch from a place that has a high probability to bring the capsule down in a city, in a lake, into concentrations of power lines, into restricted areas, etc.
- Construction classes will include lessons on writting software for the basic stamp and homework will be assigned. For those that don't have equipment they can write the software and test it on mine or Pauls equipment. We have laptops, the basic stamp, and the board of education. The next class will be parachute construction. I believe you said you bought some material.
- Prediction training. With homework.
- Projects...
- Aurora capsule. To be launched on short notice when the northern lights are present.
- Spark Gap experiment.
- Speed of sound experiment.
- NSRV Near Space Return Vehicle. (First vehicle will be a paraglider with the ability to steer to a landing site. Not necessarily the launch site.
- Data analysis project. To find an easier way to pull data from the APRS logs than Paul hunting through them.
- and more....

1439. Jeff is on Capsule Video

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-24 23:39:07 UTC
From: paulson58@juno.com
Topic: 1439 Message: 1439

Jeff-

I was showing the video at home. Had to fast forward to the Highlights. Near landing, time 11:27:22 to 11:27:24 your truck shows up in the lower right hand corner. It's only for two seconds, but I frame by framed it through. It's right where you pulled off the right hand side to let me out on the sidewalk so I could film the capsules under canopy. The camera swung through before Mike got out. I'm not sure if that would show up anyway. No doubt it's your truck letting me out though.

Dan

1440. R-value

1441. R-Value

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-25 06:20:44 UTC
From: Jeff Melanson
Topic: 1441 Message: 1441

Hi all,

I finally found an explanation of insulation and R-value in laymens terms.

Temperature is a force. It is the wind. It is a wind which passes through solid objects at different rates or speeds, depending on the physical properties of the material it is passing thru. You can measure this rate by walking barefoot from carpeting to hardwood to tile flooring. The temperatures will all be the same, but will seem very different. The tile has the highest rate and will seem the coldest, while the carpeting has the lowest rate and will seem the warmest. The "wind" speed is also determined by difference in temperature. The greater the difference, the higher the speed. A temperature difference of 40 degrees is twice as fast as a temperature difference of 20 degrees.
Insulation is resistance. It resists the pressure of the temperature's wind. It slows the wind down. R-value is the measurement of a material's ability to slow the temperature's wind. The higher the r-value, the slower the wind speed thru that substance. It takes the wind twice as long to penetrate a R20 as an R10.

http://www.warmair.com/html/insulation.htm

Does that last statement also mean that it takes twice as long for the "wind" to penetrate R2 as compared to R1 or R6 as compared to R3?

1442. Ascent and descent rates

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-25 09:02:36 UTC
From: Jeff Melanson
Topic: 1442 Message: 1442

Hi all,

Just for info:

Ascent rate at lift off was 1150 ft/min.

Descent rate right after burst was 6992 ft/min or 70.8 MPH!

It slowed to 2713 ft/min at about 58,000 ft. or 31 MPH.

The landing speed was about 640 ft/min or 7.3 MPH.

6992 ft/min is actually an even more impressive
79.5 mph.

Thanks, Jeff, for this summary of balloon vertical
velocities. This is just what I need to check
LIFTWIN predictions vs. actual balloon behavior.

Later I'll post the difference in drag force on
the parachute at peak altitude compared to near
the ground. I don't need to know chute diameter
for that as far as giving a ratio, but if someone
would chime in with the diameter, can give the
estimated drag in pounds.

Hank-

FYI. Also, the on board video from Jeffs capsule shows the Descent as being somewhat sideways. As you watch, you will see the haul line with a very large piece of remaining balloon attached. This mass of rubber falls faster than the capsules and chute. It has less resistance and therefore less drag. It appears that the Balloon remains, tied to the Chute apex causes the chute to spill on the opposite side of the line draped over the chute. This haul line was cut away at 22,700 feet. I suspect the descent rate was different than would be expected had the Balloon remains been smaller, or if the cutaway device functioned at a different time in the flight. The camera view shows a descent that looks to be close to a 45 degree angle for 71,442 feet. I would be curious to see if the Data showed different descent rates the 5,000 or so feet just prior to the cutaway, as compared to the 5,000 right after. In summary, I think if the ballon remains were not so effective in spilling the chute, I suspect the Near space mission would have drifted farther down range. This may throw off your predictions.

From: Jeff Melanson
Topic: 1450 Message: 1450

Hank,

Doug Rich talked to us about the benefits of joining VOI. For example the cost of joining is only $20 per year and the insurance policy would then cover us because we would be performing a club sponsored event. Paul still has a couple of insurance questions that Doug will look up. Another concern was that if people in the VOI radio club were against ballooning it might interfere with our missions. Doug explained to us that club members can only elect board members not vote against ballooning. The board members vote and they are all for SIG's (Special Interest Groups). If there are a couple of people against ballooning it won't matter. As a SIG we still choose our missions and organize ourselves as needed to accomplish the mission. There are other special interest groups in VOI. One of them is packet radio. Another concern is that people without an amateur radio license would be left out. The VOI allows non licensed people to join as an associate member for the same price. That means anyone can participate and insurance coverage's would still apply. As soon as Paul gets his insurance questions answered I'm sure we'll end up joining.
We also decided to do a few other things.
- Make a mission statement that describes what we are about.
- Write guidelines for mishaps. For example we'll have one person representing the group to handle exchanging information etc.
- Write guidelines for capsule construction that promote safety.
- Prediction guidelines. The purpose here is to set up guidelines that make landing sites as safe as practical. For example we won't launch from a place that has a high probability to bring the capsule down in a city, in a lake, into concentrations of power lines, into restricted areas, etc. This is something we try to do anyway but we will set guidelines for choosing the launch site. For example we will draw an oval on the map indicating the probable landing location with a built in error based on previous flights. If that area has hazards in it then we will adjust the launch site.

We also discussed future projects...
- Aurora capsule. To be launched on short notice when the northern lights are present.
- Spark Gap experiment.
- Speed of sound experiment.
- NSRV Near Space Return Vehicle. (First vehicle will be a paraglider with the ability to steer to a designated landing site. Not necessarily the launch site.
- Data analysis project. To find an easier way to pull data from the APRS logs rather than Paul hunting through them piece by piece. Mike Garske is working on this one.

- and more....

Well if this balloon group uses VOI insurance. I know I will not be part of either because of contingent liabilities and may make all members of VOI liable for things not covered by insurance. As when this came up last year the VOI membership dropped considerably for this reason, as many have voiced this to me even ones who were in the legal feild. AC7BF

From: verhap@occ1.sd01.k12.id.us
Topic: 1457 Message: 1457

I'm thinking we need to get an average estimate of the precentage error in landing range. Say something like 30%. We then predict a landing position and then travel 30% before and after the landing position. If there's an object in that area we don't want to land on, then we move the launch site. I don't know the error in azimuth, but we'll need to pick a number here also and factor that in.

So the process would lokk something like this (remember, these numbers will have to be tweaked before we impliment this).

Take a predicted landing site and draw a rectangle around it. It will measure 30% closer and farther from the launch site and span plus and minus 10 degrees in azimuth. If one of the following objects is in it, we move the launch siite.

Power plant
Power substation
City
Airport
Lake
The Pacific Ocean
Hawaii
etc....

We'll experiment with this and see how it works. Ralph, do your numbers have ranges associated with them? I'd like to convert these errors in landing into precentage errors. I'd also like to determine how the azimuth varied. It seems when we lost the TV00A flight, we had the right azimuth, but wrong range, just like the last flight.

Perhaps instead of using historical flight data, we could run predictions everyday for a week and look at how the predicted landing site changes.

I smell a project for someone to be appointed to.....

I couldn't send email this week, so here goes another try.

We had a great meeting on Friday that answered most of my concerns. Doug, have you been able to check the insurance policy yet?

I shot three boards this weekend. I should have them drilled in the next couple of days, then I'll send them out. Mark, I'll send you one now and the other later when I shoot some more.

I started some notes on construction standards. Once I type them up, I'll email to the group.

There will be a meeting this Sunday at HobbyTown. Bring your parachute materials. I'll also bring styrofoam for airframes for those of you not planning to work on parachutes.

I think the Jade Garden is an ideal place to have eating meetings, in place of Idaho Pizza.

We need a copy of the video for the Recycling Plant we landed near.

I have all email messages that contain predicted and actual landing coordinates. Some mission telemetry files and/or launch coordinates are available in web page links associated with posted record entries.

Given launch coordinates, I could calculate bearing and distance to predicted landing coordinates and to actual landing coordinates. A set of these bearing and distance values may give you a feel for the nature of prediction errors, e.g., is the "safe" landing area a circle (because errors are equally in bearing and distance), an ellipse with major axis along the bearing line (because errors are predominately in distance) or an ellipse with minor axis along the bearing line (because errors are predominately in bearing). We have a very limited data set of only 16 predictions but foci positions (magnitude of ellipse) could be defined by collective bearing errors vs. collective distance errors.

If you do not have other plans I can build the data table here so you folks can tame other dragons.

From: Mark Conner
Topic: 1463 Message: 1463

Here are some things I've done with my past flights to get a handle on the variations that might be possible for a flight. This is all done within Balloon Track.

1) Vary the burst altitude. This usually changes your landing east/west a few miles.
2) Vary the ascent rate. I use 500 and 1500 ft/min as lower/upper bounds. Does not usually change direction much, but will change distance.
3) Vary the descent rate. Same, but less of an effect. Rarely does a payload come down much slower than expected - it can come down faster due to a fouled chute.
4) Use wind predictions valid for +/- 3-6 hours from your expected launch time. Often the models have a good handle on what is going to happen, but get the timing wrong. This will let you know if there is a radical change in the winds with time (which gives downtrack as well as crosstrack error).

Since 1200Z is 5am for the Boise area, you may have access to the morning sounding from Boise NWS before a TVNSP launch. This could be used as a last-minute check for the validity of your forecast. Someone at home with Internet access and radio or cell contact to the launch crew is the best candidate to perform this. You may not need to run a full prediction - just compare the wind values from those used for the last prediction and see if they've changed significantly. If so, then rerun it.

I believe I recall this meeting. At the meeting, the members of VOI
were reminded that they voted to support some balloon activities.
Then the issue was pretty much dropped. Do I have the right
meeting in mind?

Can we get an explanation on how club members can be held
liable for club actitivtes? This seems to contradict the function of
liability insurance as I understand it.

Would a gyroscope work to maintain orientation? We could use a sun tracking device such as two photosensors on each side of a card to drive two small motors to twist the gyro in the appropriate direction, that part is easy enough I think. Or even four if we want control in all four directions (up, down, left, right). The question is, would the gyro be enough to maintain lateral orientation or would there be too much resistance from the capsules and chute?

I suppose we couldn't use an open birdcage type capsule here? Then we could use the lazy susan inside that cage and just orient that towards the sun.

Just thinking.

To control rotation takes a gyro with lots of torque. This usually
means its wheel needs to be heavy and spinning very fast. The
other problem is that when you try to tip a gyro, it will begin to
precess. This would force the capsule to begin a strong wobble
that would probably damage it.

The better use of gyros is to determine when there has been a
change in orientation and then use a second system to correct it.
This lets you get by with a smaller and lighter gyro. But if you
don't begin correcting immediately, the precession will get out of
hand.

> I suppose we couldn't use an open birdcage type capsule here? Then we could
> use the lazy susan inside that cage and just orient that towards the sun.

I'm thinking of using a motor on the top of the bottom capsule to
spin the capsule in the opposite direction of its rotation. This
would require a sun sensor to operate.

Bill,

Go to this web site.

http://cosmos.ssol.iastate.edu/RGS/

Study what they have done to develop a parasail. We need to know how to choose the right size for the payload. Watch their mpegs of test's and let's see their successes and failures. As far as I can tell they have not yet used this system. They are still trying to develop it. For now they drop the parasail off a building and try to steer in down by remote control. We can probably find some good ideas here, and some things not to do.

GPS won't tell you which way you're pointing, only which way you're moving. If you're moving east at 40 mph with the wind, the GPS will tell you that much, but not whether the capsule is facing any particular direction.

A compass module might work for this, and be easier/lighter than a gyro. Jameco has one for $50. This would give you azimuth, but not up/down.

Besides, isn't most (greater %) of the flight above the clouds?

That compass idea, though, has merit, but there's still the problem of orienting the capsule. However, and Paul will correct me if I'm wrong, I believe the idea is to stabilize the capsule rather than point it in any specific direction. I think the idea is to use counter-rotation against the capsule and to use the sun as a reference point. The compass idea would still work for this, we could just use, say, north instead of the sun.

An added bonus of using the compass is that we could then apply this against any night flights as well, without needing modification.

Electronic compasses develop errors when they tip. Perhaps it
won't be enough to seriously effect the results.

I believe the same company (Vector?) sells a gimballed compass that will handle tilts, but it's about $100.

Still, providing the torque to offset any spinning is problematic. Most of the things I've seen/heard really drive up the weight and complexity. While a lot can be learned from making Rube Goldberg devices, sometimes the practicality leaves a lot to be desired.

I think reducing sources of the spinning is a more fruitful way to go. For example, use of braided rather than spun load lines. Most of my videotapes indicate a favored direction of spin which would indicate possibly a slow unwinding of the load line from balloon to parachute. The remainder of the lines are multiples and shouldn't contribute.

What about putting a set of vertically-oriented vanes on the payload? I think this would reduce spinning about the Z axis during ascent, but I'm not sure how they'd behave during descent - would they act like wings and cause less stability, or would the parachute keep this from happening?

Jeff, and Dan,

I'll check this out, but do have a question to ask right off, before we get too into the parasail track.

I can't help but wonder, should we perhaps look at a more rigid NSRV or should we continue to pursue the parasail as the primary alternate to our current recovery system?

I'd just like to get this clarified, as it will help me determine where I need to focus most. Essentially, I'm asking which of these is our focus:

1) Parasail recovery system (PRS) for the NSRV.
2) PRS for the short term, to be replaced with a more rigid NSRV as needs are further determined based on results of the PRS.
3) A rigid NSRV (glider).
4) A parallel development of PRS and a rigid NSRV.

Bill

The parasail is the primary focus right now because it should be the easiest to accomplish. It is also the one method that would allow us to continue with a science platform. The glider probably can't carry enough payload to do science experiments. Our objectives have always included science at high altitudes. In the future we may want a rigid return vehicle just for fun.

I don't think so. A gps knows where it is, but not what direction it is
facing.

I've seen those. The name and price is correct. Jeff and I looked
for the gimbal versions in Jameco a few days ago and didn't see
them.

I've wondered about using a motor. The capsule would hang off of
the motor shaft. The motor would be commanded to rotate (using
an H-bridge) as needed. Perhaps an electric screwdriver would be
the proper motor.

We definitely want to reduce sources of rotation to begin with.
more bearings and braided line sounds like a good start.

I think they'd be ineffective at high altitudes with its lower pressure.

Hi all,

It has also been suggested that the balloon may spin as it rises through the atmosphere due to it's shape. Some balloons sure have funny out of round shapes to them. Even the ones that look round may not be perfect. On the last couple of flights of ours the video panning seems to change direction and once in a while would stop for a moment then slowly drift around again. I like the slow panning effect. The idea of a despun section (in my mind) is to be able to point a camera up into the black of space and be able to keep the shutter open long enough to capture starlight. Pauls idea is to use a motor at the top of the bottom capsule that would rotate the capsule to keep it oriented in one direction. This would not take care of swinging sideways or to and fro. In calm conditions the swinging might not be a problem. The panning always will. Remove the panning effect, point the camera and take several pictures. At least some pictures should turn out.

Hank, we're located near Boise. If you can arrange a visit, we'd
love to have you come out to a meeting or launch. I'm also
planning another mass launch this July in Kansas, it that would be
easier.

We'll do a better job and get that weight and lift data to you. right
now with our accident, that's been put back a step.

Along the lines of thinking on vertical vanes, what about air-brake style vanes, like you see on NASCAR cars, that would open against the 'wind' and retract with it ? You'd have to have two on each side, oriented in opposite directions.

Tim.......

From: Jeff Melanson
Topic: 1484 Message: 1484

Paul,

I am finishing the last two copies of the video tapes right now. This includes everyone on the list and those names added later and the recycling plant. Can you stop by tonight and take the ones your going to deliver? I'll give you the addresses of those that have to be mailed. I will bring the rest to the hobbytown meeting on Sunday at 2:00 pm. For those of you who can't make it to the Sunday meeting we'll need different arrangements. You can come by tonight or get your copy at a future meeting.
I off work tonight because I'm staying home with a chest cold. I promise not to cough on you!

Bill-

Good questions one and all. First I concure with Jeffs comments. We have debated back and fourth a bit on all this. However, the Parafoil is undoubtedly the way to go to start. There are several good reasons.

1. Lighter weight- Since this takes the place of the standard parachute, their is little extra weight in a package like this. You need at least a single servo and whatever mounting method you decide to employ. This also means fewer new systems or Unknowns into the fray. Just software working with a servo and compass.

2. Safety- If the control system fails, at the very least you are still coming down under a canopy. You can throw out your descent calculations at first. Once you know what your glide slope is, you can figure that with wind direction and speed and get close.

3. Ease of transport- self explanatory, and not likely a real issue.

The idea of bringing a Shuttle like vehicle from Near Space, back to where you launched, just intrigues the heck out of me. Maybe too much so. I hear people yelling at me' "Sir, Sir, your next". I'm in line at a grocery store and had at least 30 seconds of free time. I drifted off trying to see in my minds eye how best to connect the servo to an elevon to minimize flutter, but have it weigh nothing. Honk, Honk, Oops, the light changed and I'm still sitting there wondering if their should be retractable landing gear or just a skid.

Jeff has it right though. He says getting it back to where you launch is a fun idea for the future. But, in the interest of safety, while keeping room for experiments, don't try to bring it back to the Launch site. Bring it down someplace downrange where it's not only easy to get to, but gives you control for safety reasons. (We all know what that means) This also keeps it on the Ham side a bit more. The tracking is not only a very fun part, but is the only draw some people have to the whole launch. He says we need to work hard to make sure the Science or the Ham never gets one above the other. That this is a joint effort that brings the two groups together to share ideas and technology. It works for a bigger more diverse group this way. I couldn't agree with him more.

We did some preliminary checking on the Parafoil. Their seems to be a couple of companies making parafoils for RC. Only a few are really high end and would stand up to this type of extreme use. www.airfoilaviation.com is likely the best. They know their business. I got estimates of weight and sizes from them. They already have the ground work done. They make them for hobby and light industry.

They say that their 1/3 scale chute would work best for a 6 to 7 pound payload. But at $325.95 for a replacement chute, it's out of our reach for a while. The more I looked at making one that size, the more I steared for theirs. (Thats not a real pun is it) The cost of Materials would be more than their completed unit. Plus, I would have to make a handfull of them before I got it right. Uh, if I got it right. It is, in my opinion, cheaper to get one like theirs than to make one. They are complex and need to be airfoil shaped to work. We have therefore put the whole idea off for now. It's just not in our reach. Certainly there is room for other ideas. We have simply held off discussing it here in leu of other issues. Perhaps it's time for resources to ring in on this one. It's on the table. Maybe some Web wizzard can find a better deal than I could.

When the balloon flies, it travels with the wind. As far as the capsule is concerned, there is no wind (ideally).

Maybe a more accurate presentation of TV would be to say, look at a topo map of SW Idaho. TV runs in that broad valley that pretty much follows the Snake River and runs from the Oregon border (Ontario, OR and Payette, ID) to Mountain Home. That should give you a visual representation of Treasure Valley.

1491. Parafoils

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-27 22:45:39 UTC
From: paulson58@juno.com
Topic: 1491 Message: 1491

I found the information I had gotten from Airfoilaviation a few weeks ago. It jogged my memory a bit more. I'll just post it below.

Can you guide me to one or two of your chutes that would be most suited for a 6 to 7 pound paylaod?

The 1/3 scale chute would be best suited for that payload. Thanks

airfoil@...> writes:
The 1/8 and the 55" are $79.95
1/4 $144.95
1/3 $325.95
1/2 $425.95
The 1/2 scale chute will carry the 16lb. payload very easily.
Thanks

I'm sure you all get the idea. I will state that the one they recommend may not be the one we need. They don't like to discuss uses outside what they are intended for but, these units are designed to go up as well as come down. They are designed to hang a prop driven pendulum type craft underneath. From small electric up to huge Chainsaw size gas engines. Throttling back causes descent. Powering up will actually moves the pod forward, angle the parafoil to a steeper angle of attack, and lift up. The chute is sewn so that it fills with air and takes on a lifting airfoil shape. Shifting the load left to right under the parafoil suffices to steer left and right. I think, that since we don't have to go up, only descend, that we should be able to get away with a smaller one. It doesn't have to fly for us. Just steer and decay descent rate to a reasonable impact. It is inherently stable.

I visited the HABET site for the first time in a while, and finally perused some of the old mission files. Go to the page below and click on the Missions button on the left. Then pick a missing and go to the bottom for the video clips. Some nice ones in there. They are kind of large (typically about 10 Mbytes), but good. The landing video for L53 is particularly neat.

The COSMOS site is the old name, there is a newer one. The
landing I watched was neat, but took a while to download.

We should start out the same way with a tethered test.

Ralph, how balloons has SSOL launched? I thought it was 53, but
I see missing mission numbers

1494. 600g balloons for $25

From Electronic Goldmine's recent catalog:
http://sales.goldmine-elec.com/prodinfo.asp?prodid=4071

Giant Weather Balloon - G12848
Brand new meteorological balloon made by Scientific Sales features an inflated size of 5.8 feet and a burst diameter of 19.7 feet. Inflation neck size is 1.3 inch and color is natural color rubber. These uniform wall thickness balloons are ozone resistant and come sealed in a moisture proof sealed bag. Each balloon has been factory inflated, inspected and tested before being dusted and sealed in the package. Weight of the balloon is 600 grams and maximum gross lift is 3550 grams (7.826 pounds); (1800 gm free lift and 1150 gm payload). These are worth many times our price! G12848
Manufactured by Scientific Sales
Price: $24.95

Date: 2001-11-28 01:45:33 UTC
From: Stephanie Steele
Topic: 1495 Message: 1495

Please post the address for Hobbytown and the meeting time. I am going to try and make it but I was unable to purchase parachute materials.

Stephanie-

The address is 3317 North Cole rd.
It's in a strip mall on the NW corner of Cole and Ustick.
Last I heard, the meeting was at 2PM. Hobbytown closes at 5 PM.
Can someone confirm this 2 PM start for both of us?

Hobbytown

3317 N. Cole
Boise, Idaho
208-376-1942

It is in a small shopping mall on the corner of Cole and Northview.

Meeting time is 2:00 pm.

1499. HABET mission numbering and RGS

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-28 13:28:19 UTC
From: Ralph Wallio, W0RPK
Topic: 1499 Message: 1499

>
> Ralph, how balloons has SSOL launched? I thought it was 53, but
> I see missing mission numbers
>

HABET web pages start at http://cosmos.ssol.iastate.edu/HABET/ .

I haven't been active with ISGC SSOL and HABET programs on a day-to-day basis for a couple of years but I know they are not concerned about consecutive numbering of actual flown missions. There were several different numbering schemes in the early years as we changed student staffing almost every semester. More recently SSOL and HABET have had much better semester-to-semester and year-to-year continuity.

Current HABET numbering is based on project acceptance and funding. When a project is started it is assigned the next number in sequence and identified as light (L) or heavy (H) or tethered (T). The project develops with this assigned number but, like STS, it could easily fly out of numeric sequence or, in a few cases when funding dried up, not fly at all.

In the early years we called controlled descent capabilities HABET-II but they were more recently renamed RGS, Recovery Guidance System. Along the way RGS capabilities have been the subject of two MS Aeronautical Engineering thesis papers and numerous multi-discipline senior engineering projects. None-the-less as can be seen in their web pages, RGS capabilities are not in routine use.

I encourage you to tackle the very interesting and significant challenges with controlled descent. Everyone that gets involved will learn a great deal regardless of the final outcome. From experience I can say it looks easy on the back of an envelope but years will slip by while dealing with the devil in the details.

1504. Analysis of track prediction errors

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-28 16:01:10 UTC
From: Ralph Wallio, W0RPK
Topic: 1504 Message: 1504

Analysis of submissions to Amateur High Altitude Ballooning Records - Touchdown Prediction Closest to Actual Coordinates (see http://users.crosspaths.net/~wallio/records.html) might help us understand our collective track prediction state-of-the-art which results in uncertain payload landing area coordinates and circumstances.

There have been 16 submissions to our - Touchdown Prediction Closest to Actual Coordinates - category for which errors have been calculated and posted as great circle distances between actual and predicted landing coordinates. (The first entry has not been included in following analysis because it resulted from a planned cutdown at only 9,000ft AGL.)

1. Eric Hauber ISU/HABET-L53 26Sep01 10kCC 0.23 Miles
2. Bill All, N3KKM NSTAR-01B 19May01 95kNB 1.24 Miles
3. Mark Conner, N9XTN NSTAR-01B 19May01 95kNB 5.58 Miles
4. Rick von Glahn, N0KKZ EOSS-48 01Apr01 90kNB 8.16 Miles
5. Mark Conner, N9XTN NSTAR-00B 04Nov00 74kNB 10.71 Miles
6. Mark Conner, N9XTN NSTAR-01C 24Jun01 83kNB 10.72 Miles
7. Mark Conner, N9XTN NSTAR-01D 30Jun01 91kNB 11.07 Miles
8. Rick von Glahn, N?KKZ EOSS-46 14Jan01 92kNB 11.24 Miles
9. Rick von Glahn, N0KKZ EOSS-47 25Feb01 93kCC 13.23 Miles
10. Rick von Glahn, N?KKZ EOSS-45 19Nov00 90kNB 13.54 Miles
11. Mark Conner, N9XTN NSBG-NS1-1 28Apr01 77kNB 13.54 Miles
12. Eric Hauber ISU/HABET-L52 15Nov01 90kNB 14.36 Miles
13. Rick von Glahn, N?KKZ EOSS-52 20Oct01 92kNB 16.48 Miles
14. Mark Conner, N9XTN NSTAR-00A 07Oct00 83kNB 16.99 Miles
15. Mark Conner, N9XTN EOSS-44 01Oct00 91kNB 17.53 Miles
16. Rick von Glahn, N?KKZ EOSS-44 01Oct00 91kNB 17.88 Miles

The maximum great circle distance between submitted predictions and actual landing coordinates approaches 18 miles. One way to respond to this prediction performance is to consider this distance as a radius of uncertainty and then selecting a safe landing area 36 miles in diameter. Planners can then place the landing end of a predicted track at the center of this safe area and expect the release end of the predicted track to define launch coordinates required to land in the safe area.

Further analysis of these submissions can give us an even better understanding of the nature and magnitude of prediction error. Mission data associated with these entries can be used to calculate actual and predicted bearings and distances from launch to landing coordinates and then predicted bearing and distance errors.

EOSS-48 (http://www.eoss.org/ansrecap/recap48.htm)
Launch: 40.4744dN 104.9628dW
Landing: 40.1586dN 103.1577dW

Bearing/Distance: 102.34d/97.57 miles
Predict: 40.0675dN 103.2561dW
Bearing/Distance: 106.80d/94.27 miles
Bearing Error: +4.46d
Distance Error: -3.30 miles

NSTAR-01B (http://members.home.net/mconner1/nstar.html#01B)
Launch: 41.2225dN 96.3245dW
Landing: 41.1317dN 95.2977dW
Bearing/Distance: 96.36d/53.77 miles
Predict 1: 41.1841dN 95.3794dW
Bearing/Distance: 92.78d/49.20 miles
Bearing Error 1: -3.58d
Distance Error 1: -4.56 miles
Predict 2: 41.1373dN 95.3204dW
Bearing/Distance: 96.10d/52.55 miles
Bearing Error 2: -0.26d
Distance Error 2: -1.22 miles

Bearing and distance errors are then extracted to understand any biases that might reduce the previously discussed 36 mile diameter safe area:

+115.23d
+15.00d
+7.43d
+7.33d
+6.14d
+5.83d
+4.46d
+3.53d
+0.91d

-0.26d
-3.33d
-3.58d
-8.27d
-8.61d
-21.09d

+17.27 miles
+16.19 miles
+15.32 miles
+12.54 miles
+11.04 miles
+8.66 miles
+6.69 miles
+2.03 miles

-1.22 miles
-3.30 miles
-3.70 miles

-4.56 miles
-7.22 miles
-10.25 miles
-11.98 miles

The distribution of bearing errors and distance errors is fairly even across our small sample of record entries. Therefore it does not appear we can reasonably distort the shape of a safe landing area from a circle to an ellipse. There does not appear to be any bias that would support this change.

Finally (sez the reader), we can take consider actual track distance (ATD) vs. great circle error (GCE).

EOSS-44
ATD: 43.14 miles
GCE: 17.88 and 17.53 miles

NSTAR-00A
ATD: 118.54 miles
GCE: 16.99 miles

EOSS-52
ATD: 52.40 miles
GCE: 16.48 miles

HABET-L52
ATD: 53.46 miles
GCE:14.36 miles

NSBG-NS1-1
ATD: 9.78 miles
GCE: 13.54 miles

EOSS-45
ATD: 83.06 miles
GCE: 13.54 miles

EOSS-47
ATD: 62.58 miles
GCE: 13.23 miles

EOSS-46
ATD: 41.56 miles
GCE: 10.25 miles

NSTAR-01D
ATD: 43.60 miles
GCE: 11.07 miles

NSTAR-01C
ATD: 13.47 miles
GCE: 10.72 miles

NSTAR-00B
ATD: 61.29 miles
GCE: 10.71 miles

EOSS-48
ATD: 97.57 miles
GCE: 8.16 miles

NSTAR-01B
ATD: 53.77 miles
GCE: 5.58 and 1.24 miles

The range of GCE/ATD is from roughly 10% to over 100%. There does not appear to be a pattern or other reason to adjust safe landing area radius in relation to predicted track distance.

Based on this analysis I recommend that a safe landing area be defined as a circle with radius equal to our collective worst prediction error or roughly 18 miles. This radius should not be shortened until we have a significant track record of improved prediction skills.

Now the tougher question: What is a safe landing area?

1505. Chute for display

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-11-28 16:02:34 UTC
From: paulson58@juno.com
Topic: 1505 Message: 1505

Paul-

Two issues. 1. Can we get a scale determined for a static display stack. I know a few different ones were discussed, but I think I'll only have time to get one size done in the midst of all my other projects.

2. Also in reference to the static display model, Can you come up with a chute? I know the scale will be off if your material is used due to thickness. But, if an Estes Model Rocket chute or something like that is used, the durability will be sacrificed.

Dan

Topic: 1504 Message: 1507

I'll add my two cents' worth of meteorology to Ralph's analysis.

Wind direction for light-wind conditions is more difficult for the forecast models to predict than the direction of stronger winds. So, if you have a wind profile that produces a short distance, the azimuth error becomes greater.

As the winds become stronger, the direction error is reduced but the speed error increases. The two errors offset one another in such a fashion that something close to a circle is probably the best approximation of the error distribution.

It would be interesting to see Ralph's prediction data graphically in a downtrack-relative plot. The forecast landing would be at the center of the plot, and the azimuth from launch to landing would be up. The actual landing relative to the forecast would be plotted. This would show the left/right and near/far distribution of the actual landings relative to the forecasts. This might show whether an ellipse with the major axis along the flight path is better or not.

Bill,

That's exactly the description I was looking for, especially
what's considered the east end of TV. Figured it was east
from Oregon along the Snake, but how far was the big question.

Bill-

Yep, I heard Jeff and Paul discussing that some time back. The Parafoil kites I mean. Also, there was some idea's thrown around to do some off season drop testing. My understanding has become that Paul heads up those activities. I've been designing and developing as a Hobbiest for quite a few years. I've gradually steered away from the "complete" do it yourself concept in all instances. My experience in these types of projects is still what I stated in my previous response. Put a little differently, I don't want to spend time or Money re-inventing the wheel. By the time you get it done, you have spent more time and money than if you just went out and bought a pre-made tire. I feel differently when it's time to put an electronic circuit for 35.00 into your project. If you can make it for a 5 or 10 dollar handful of parts, it's always better to make your own. You can tweak it to your own specs as well. I also have no trouble dumping your all into a project that you feel driven to do. I learn and take away valuable experience and knowledge. In this case though, there is a body of knowledge, thats been collected for years, out there on Parafoils. How they work and what to do to it to make it work for you. If we spent the next year and 2000 dollars in material, helium and Balloons, plus many man hours of testing, we could only hope to be where those parafoil companies already are. I consider that both expensive, and slow moving. A quick disclaimer though. Thats just me. My interest simply isn't there, but someone elses may be. I would encourage any efforts to get the NSRV as a reality. At this point, I see there is no commercialy available guideance and control system to do the job. Thats what appeals to me. A comment made just a few messages ago states, it's easy on paper, but may take years to do. (Or words to that effect) I agree. I have no problem with helping out in some way. But the guideance system is the real problem. I also won't participate in parachute testing unless some changes are made in the location at the very least. Someone may emerge in this group that feels a drive to learn and make parafoils. You have my full support and I will do what I can to help you succeed. When I weigh what I know of my time, skills and interest, I'm simply not the best person for that task. I don't see anyone else ringing in on this.

Maybe someone can find plans on how to make one, and what size to make it for a given load weight.

Don't know if anyone cares, but the Treasure Valley used to be called the "Lower Snake River Valley" in school athletic conferences, etc., until a Chamber of Commerce or two got into the act, and decided it should be referred to as the Treasure Valley. The former name has all but disappeared, except as a geographic description.

A one cubic inch capsule would be at a scale of 12 to 1. The total
height of a stack is about 50 feet.

>
> I have completed a downtrack-relative plot and sent it off to Mark for his
> comments. I will send you the final result.
>

A downtrack-relative plot is attached. It was created by laying out all predictions along the same line from launch (launch position shown for orientation but is to scale only for EOSS-44(1). Prediction distances were plotted to scale along this common line. Actual distances were also plotted along this common line but then swung north or south by differences between predicted and actual bearings. Finally, prediction and actual plots were locked to each other and then moved east or west so that all predictions are at the same point (the bull's eye).

This small sample shows a slight bias up and left from the common prediction point (Mark comments that the LEFT part, e.g., landing short of prediction, may be due to our collective bias towards overfilling). This slight bias might almost disappear if we had a larger sample. I know of no reason for the UP part.

This plot displays the same data I previously sent but it's visual nature may be of some value for mission planning. I still do not detect a rationale for safe areas to be other than a circle and it appears the radius should approach 20 miles. Here in Iowa a safe area of this magnitude would cover most of four counties including four county seats, several small towns and hundreds of miles of high tension lines. However, when looking down from aloft far less than 1% of surface area is anything other than open agricultural fields and pastures.

Don't forget the next meeting this Sunday, 2:00 PM, HobbyTown.

We'll start on parachute design as our first lesson. For those of
you not working on 'chutes, we'll get you started on airframe design.

The Basic Stamp lesson will be on the physical layout of the BS-2,
it's electronic layout, and the structure of bits, nybbles, bytes, and
words. After this lesson you will be able point out the pins and
their functions, how to define variables, and know what is their
maximium number.

Date sent: Fri, 30 Nov 2001 20:41:34 +0530
Organization: Sensors Technology Pvt. Ltd.

These are industries best sensors I have ever used for environmental
humidity measurement and I don't think anyone can give at better price then
offered by me.

I can't ship less than 20 as they are already packed up for delivery. There
are 10000 sensors in total for this 50% reduced cost shipment scheme. HS1101
is offered at only $120 for 20 sensors. You also order now and pay after you
get them. What else could be better. Datasheet and application notes are
also packed with the sensors. Other information available at
www.humirel.com/

I love these sensors and hope others will love them using as well. I am not
the manufacturer of these sensors, Humirel (which has Motorolla Engineers)
is the manufacturer.

Jeff,

I agree with you, especially wrt re-inventing the wheel. Like you, it's the electronics and controls I'm more interested in at this point. I'd like to learn something about the parafoils themselves, which actually is a necessity in learning to control them anyway. I often take the cost approach: can I make it as well for less? If not, purchase the darn thing and study it and use it. If I can, investigate and make my own, if time allows me to do so. Of course, there are some things that are better understood and utilized if you build them yourself.

BTW, regarding my comment about the location of Hobbytown, I take that back. I was thinking of a different hobby store over by the Boise Towne Square Mall. Just found out that ain't it. :-P

Dan,
We've got some thru-hole sockets that are for surface mount, but not the other way around. We have taken surface mount parts and created daughter boards with thru-hole pins, and that gets pretty involved, but it can be done. And even with .01 lead spacing.

Tim

Tim-

Actually what I have is a little odd. I have a few 8 pin suface
mount chips. I need to breadboard a design but need these to be
in a standard Dip package. .3 row spacind with .1 pin spacing. Are
there carrier sockets or can you think of another way I can use them.

Tim-

OK Thanks. It was just an outside shot anyway. I knew it was a fairly goofy request. I'll look around and come up with a solution.

Dan

> Dan,
> We've got some thru-hole sockets that are for surface mount, but not the other way around. We have taken surface mount parts and created daughter boards with thru-hole pins, and that gets pretty involved, but it can be done. And even with .01 lead spacing.

Anybody recall how long the meeting is projected to be? BTW if you are running APRS I posted an object for HobbyTown to make it easier to find.

What do we need to bring?

Bill

Bill

Thanks for the posting of Hobbytown on APRS. I would have ended up on Milwaukee where there is ? or used to be a hobby store. Used to visit it when i was into RC flying. Being an out-of-towner this really helps.

I believe it was mentioned that it could run from 2-5 pm. That is when the store closes on Sunday? With the agenda proposed by Paul,sounds like it could run that long.

Look forward to seeing some new faces and talent.

My understanding is we will first cover Construction techniques. Parachute and Capsule both. Paul said he was going to bring some foam. Next is a starter section on the Parallax BASIC Stamp. Jeff and Paul were going to bring Laptop's and some programming materials. The Stamp is used not only on the capsule's, but is a very popular processor for Hobbiest Robotic, Light industrial, Science, Cyber art, you name it. I am a newcomer to this but will have a couple of small wheeled Robots for demo. It should be good Material to get newcomers to BASIC language processors started.

Hi Paul,
If I understand correctly you can order the BOE but not the BS2P Chip on the educational discount. The part number for the BOE is 28102 and is priced at $109.00 and the BS2P24-IC is $79.00. Please send me the total that I need to send you and I'll get payment on the way. Maybe I can have it before our next meeting. Thanks!
Great meeting tonight!

I got word back, the cost for the sensors includes shipping. So your cost is only $6 per sensor. Threse are capacitors that are sensitive to the RH. A RC circuit using the RCTIME command can be used to determine the RH. Also, you can hook them up to a 555 and use the COUNT command to determine RH.

I don't pay for these until I receive them. Once I get them in the mail, I'll ask for your checks.

So far Ralph, Mark, Bill, and Hank have saked for some. I'll keep four of the 20 for myself.

Paul,

What happens to the comments in a BASIC stamp program?

For our homework you asked us to add comments. Do these comments use up memory? I'm assuming that they are not sent to the BASIC stamp because you can't retrieve them anyway. They probably stay in the editor only.

Stephanie, the homework is for you to write four lines of code defining four different size varaibles (numeric values). There are four sizes I discussed at class, you have write a varaible for each one. After the command, place a tick (') as a remark delimiter and then write a comment specifying the largest number that can be stored in that variable.

I'll grade this over email.

I've ordered 20 of the RH sensors.

Mark, I'll need your address again. I thought I saved that last time. I suspect the rabbits are hiding things like this from me. I have a copy of the directions and two of the CC/PS boards to send you.

I'll try to get all the video tapes out this weekend. The post office is closed when I get out of school, so this has to wait until Saturday.

The school district suffered a failure of its email server. It looks like that is fixed. But now I can't get out on the web. I was able to read messages, so I heard what you said about me!
;)

1550. Catching Up, pt 2

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-12-06 19:18:26 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 1550 Message: 1550

I've designed a PCB for the RH sensor. It includes a LM335. so
together you can measure temperature and RH. Once I relearn my
op amps, I'll add a pressure sensor to it.

Mark, can you give us your experience with the BX-24? For the
rest of you out there, the BX-24 is a pin compatiable replacement
for the Basic Stamp 2. My impression is that it is more difficult to
use. I don't know anyone who has switched over from the BS2 to
the BX24.

Paul

1551. BX24 "review"

I'd be interested in such a board.

> to use. I don't know anyone who has switched over from the BS2 to
> the BX24.

My experience with the BX24 consisted of reading the manual a little bit and in October shipping it off to Parallax for their upgrade offer to a BS2p.

The biggest problem for me was the fact that serial data handling is a pain. In particular, the equivalent of the WAITFOR command would have to be coded myself and data read/written byte by byte, rather than any formatted I/O.

From reading the BX24 list, many people encountered unexpected "traps" where the processor would unexpectedly hang or otherwise act weird. That killed it off right there for me - the last thing I need to worry about is a possibly flaky compiler or processor. The only instability I've ever had with a BS2 is what I think was stray voltage on the ATN line causing uncommanded restarts. I got that cured by grounding it when it's not used.

On the good side, the BX24 had floating-point math capability, more program space, and more variable space. I think it may have had faster execution (but I didn't need that part). But the potential instabilities and the learning curve were too much to cause me to convert.

1552. Hank's Sondes

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-12-06 21:59:06 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 1552 Message: 1552

Hank, do you want to discuss your sonde design? I'm interested in making a line of dropzondes that would transmit single measurements, like temperature. They would be dropped from the near space capsule which would also turn on a tape recorder. Transmissions from the dropzonde would be recorded for 30 minutes then the tape deck would be rewound. Then the capsule plays the tape over the radio. It would be like the Galileo or Cassini, both of which will (or have) dropped atmospheric probes.

I'll design the PCB for the sonde electronics. I'll also start making bodies by vacuum molding polystyrene.

&&**#$@$%^%$

It took me 2.5 hours to get to work today!

I spent 10 years in the midwest and they get weather a lot worse
than this. I get the distinct impression that if I built a brick wall
across the interstate, Boise drivers would speed up.

It looks like we had a little bit of black ice on the roads this
morning. The accidents were pretty severe. The few accidents we
had fouled traffic all across Canyon and Ada county.

Thanks for letting me vent.

Thanks, Paul, for sharing this. I don't feel so bad now about spending an hour and half going from 2 miles west of Linder to Eagle Road this morning.

It isn't the Boise drivers that are at fault, it's all the Californians that moved here. *G&D & running for a hidey hole*

What was bugging me was that at that time there was just wet pavement. Why the heck was the traffic so bad? Was everyone that normally took the freeway now on highway 20/26? Sure seems like it, based on your message.

From: verhap@occ1.sd01.k12.id.us
Topic: 1556 Message: 1556

Rick, we have an XL t-shirt. Will that work for you?

Ralph, I have a video tape for you, but no address. Can you email me your address?

Jeff, I need to know what jacks get the resistor and capacitor for the DJ-S11. Can you look at your notes? I also need to know if it's the tip or the ring.

Mark, the PCBs and documentation I'm sending says to use #2 hardware to mount the daughterboards. I've found out that's too large for the MIM. It should read #0. Also, plastic model cement glues polystyrene beds to the PCB. I'm going to recommend that the daughterboards are bolted to the CC/PS PCB with shaped polystyrene beds.

1558. "Son of TinyTrak" as possible MIM/TNC replacement

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-12-07 19:57:32 UTC
From: Mark Conner
Topic: 1558 Message: 1558

Some of you may have heard of N6BG's TinyTrak kit. This kit is similar to a MIM in that it will transmit APRS positions with a GPS and radio hooked up to it. It doesn't do telemetry, but has other functions the MIM doesn't.

There is some code written by another ham called "Son of TinyTrak". This code can be programmed on to a PIC that will drop in the TinyTrak circuit board. It's kind of like an open-source version of the TinyTrak code.

My thought was a modified version of this code might substitute for a MIM or KPC-3. I'd still like to have something that would work like the transmit side of a KPC-3 in converse mode. This way I can format the data payload with the Basic Stamp however I like - the unit simply adds on the callsign and path in the proper format.

The code is available in the files area of the "TinyTrak" group on Yahoo. I'm not a PIC programmer and my C is pretty rusty. Is there anyone on these groups who would be interested in looking at this? It would seem to me that code capable of functioning as a converse-mode TNC would be useful to several balloon groups.

I'm interested. I'll need to get more info, but I could modify a
CC/PS to use it. I suppose the BS2p would be responsible for all
telemetry.

>
> Paul

That's what I'm planning anyway. The BS2P would format the APRS packet
and the telemetry. The TinyTrak would take the serial output, prepend
the callsign and path in the correct AX.25 format, and bang out the
audio tones for the radio. That way you're not locked to someone
else's formatting. We don't need the the overhead of a full TNC
because we're just sending UI frames and we don't care about data
reception.

With the MIM, I think we're taking advantage of a "bug" instead of
a "feature" to get the data out how we want it.

TVNSP,

If you're looking for a GPS beacon, I've built one for our balloon group, ANSR - Arizona Near Space Research, in Arizona. It is designed to run from a single lithium (3VDC) for 48 hours, sends $GPGGA/$GPRMC packets, and a plain text telemetry message that shows temperature, battery voltage, and a vertical speed indicator for balloon work. Complete board layout, schematic, and source code are on my web site:

http://www.kd7lmo.net

Good luck with your projects.

From: Hank Riley
Topic: 1552 Message: 1565

> Hank, do you want to discuss your sonde design?

Paul,

Yes, I could do that, but for the benefit of the list,
you and I are still working on the lift experiment
from the November launch.

Once that experiment is concluded, I can talk about the
expendable SkyQuest controller/transmitter system,
and why that system places a little more burden
on ground stations than a typical recovered balloon
payload. Currently recovered balloon means everyone
except SkyQuest and HamBone (formerly ITA), both in the
northeast (not a total coincidence).

I also have posts upcoming about the Basic Stamp replacement
that Mark has reviewed for us, and the latest list topic of
PIC based packet circuits and schemes.

Great stuff on this list!

Hank

I've just been speaking with Mike this week after discovering
his designs about a month ago.

Mike does not have extra fabricated boards; he etched them
himself.

I have not seen "tini trak" or the "son of." Unless tini trak
is the name of the TAPR PIC board.

But Mike's Micro Beacon is outstanding. I would like to
have a batch of fiarly high quality boards made by someone for
his basic design. Parts can be omitted, such as the GPS, and
the software can be modified for special custom needs. The
converse mode advocated by Mark could be added.

Back in my high school days I started making such high quality
boards from my own 4 x 5 negatives (from a camera), so I can
do this, but I haven't done it in quite a while.

I wrote an article for Circuit Cellar Inc about making PCBs. I have my class making them now (we shot 3 of them in my first period class yesterday). I can make baords if it's allowed by the designer.

1574. RS232/TTL conversion for M12

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-12-08 19:28:03 UTC
From: Mark Conner
Topic: 1574 Message: 1574

Hi Mike,

You're using the Oncore M12, right? I'm getting ready to fire mine up for the first time, and the first thing I need to do is set it to output NMEA.

The only thing I have to connect to the M12 to command it is a desktop or laptop with "true" RS-232. I'm guessing that's not good (or usable) to hook up directly to the M12 and that I'll have to create a circuit that will invert to TTL logic using 0V and 3V levels. Do you have a circuit that can do this? I don't have a MAX23x chip on hand, so I'm looking for Radio Shack type parts for this.

Thanks for any help or pointers.

- Mark

Paul, I wish I had a scanner. Hmmm... Christmas is coming.

I will try to explain it here but you may want to borrow the schematics I have and make copies for your records. Any chance that you can come over Sunday? I have some questions about the flight computer I'm assembling.

One end of both the capacitor and the resistor tie together and go the the Mic tip on the 2.5mm plug. I am not clear on whether or not this plug is stereo or mono on the DJ-S11. I use a stereo plug and it works fine. Maybe someone can jump in and clarify this. The other end of the Capacitor goes to Pin 1 of the TNC which is TX Audio Output. The other end of the resistor goes to Pin 3 of the TNC which is PTT. The capacitor value on the drawing says .1 to 1.0 uF. The resistor is 4.7 to 33K. Another drawing specifies .22uF and 22k ohms. The sleeve of the Mic plug goes to Pin 6 of the TNC which is Ground. The ring of the Mic plug (if a stereo plug) is not connected.

Hope this helps.

On that scanner thing again, what do you all recommend for minimum specifications i.e. resolution or whatever? I want something economical and easy to operate. Perhaps a combo printer and scanner? Refilling the ink must be cheap. I use black and white. I don't seem to have a need for color but you never know.

Jeff

1576. Re: [tvnsp] RS232/TTL conversion for M12

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-12-08 20:27:21 UTC
From: Mark Conner
Topic: 1574 Message: 1576

Well, since I accidentally send this message to the TVNSP list, I'll just go ahead and follow up a bit to both lists now.

The Oncore M12 docs say that the serial I/O logic is 0V to 3V, "active low". If I remember right, RS-232 is also "active low".

If that's the case, I don't really need to do any inversion, but just limit the voltages. I think the absolute limits are -5 and +5. So if I construct a voltage divider that knocks the voltages down to about +/- 3V, that should let me use a regular serial port on my computer to talk to the Oncore, right? The receiver has a pretty high impedance on the serial lines.

Yes. RS232 is inverted with respect to TTL. This has caused me
no limit of head banging. Did I tell you I didn't get my security
deposit back because of the cracks in the walls?

> If that's the case, I don't really need to do any inversion, but just limit

You may be fine sending it 0 to 5 volts if you put a current limiting
resistor in the data line. This is what they do with the Stamp.

Since the M12 doesn't go negative on its serial line, a Stamp may
be just fine to talk with the M12. However, the 0 to 3 volt output
may not be readable by the PC. The BS2 uses 1.4 volts as the
break between a logic low and a logic high. My students
experimented with this last year, but I don't think its significance
made an inpact on them.

Congrats Justin. Are you buying the pizza?
Have you started shopping around for an HT yet?

During Spring Break there will be a conference in NM on space and robotics. I plan to present. Is anyone else planning to go? If you don't, who knows what stories I may tell. And I won't let the truth get in the way of a good yarn!!

I'm waiting for word from KSU on using the campus for a mini-symposium. They're looking at their schedule of events.

1582. Meteoric Dust

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-12-08 23:23:58 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 1582 Message: 1582

DCI is trying to collect meteoric dust from their roof top. since this is in downtown Boise, there's lots of crud up there. In the microscope we saw rounded, magnetic material. Some of that may be meteoric, but most is probably from local welding shops.

I proposed that we send up a balloon to collect meteoric dust for DCI (and ourselves). I've email Dr. Brownlee at U of Wash, who is an expert in this field. He's a PI on the Stardust mission.

I'm dreaming now, but think we can send up large styrofoam sheets to do the collecting. The plates need to be covered in sticky material, which needs to be applied in a clean room. The plates will be uncovered by a servo once the capsule climbs above 50,000 feet and closed before balloon burst. After recovery the sticky material is washed off and examined for rounded, magnetic beads. Several control plates will be needed.

So anyhow, this is something we can engineer in a few seconds of thought (not). I'll let you know what Dr. Bownlee says. If you have any suggestions, please help. We need a clean space to set up the plates and microscopes to examine the materials.

Oh, and another thing. DCI plans to have a Legos programming class this summer. I mentioned that we're learning how to program Stamps and that we (okay, maybe it's just me) would like to teach this to students at DCI. I also said we could carry a Legos experiment up on a balloon for the students. This would be great to record on the cmacorder.

One other thing. Bruneau Dunes has expressed an interest in us doing a launch from the park. We'd need to set up a misison control for the students/visitors and give a presentation. They should be able to pay for the flight as part of a speaker's fee. I'm sure we'd get free camping also. Just something else to plan for.

Hi Paul,
If I understand correctly you can order the BOE but not the BS2P Chip on the educational discount. The part number for the BOE is 28102 and is priced at $109.00 and the BS2P24-IC is $79.00. Please send me the total that I need to send you and I'll get payment on the way. Maybe I can have it before our next meeting. Thanks!
Great meeting tonight!

To All,

Thank you everyone for your kind comments. Sorry about the advertisements, I don't know how to remove them. I figured that's how Yahoo makes it two cents (or perhaps many cents). Obviously the first thing I need is a radio of some sort. I want to start off with a nice base/mobile station and be able to do APRS. I've been eyeing the Kenwood TM-D700A for some time now, and now I have an excuse to justify the $600 price tag. Maybe Santa will look capriciously in my favor. I did want some feedback from anyone who can tell me about this rig; pros & cons. I don't know much about antennas so any feedback for a good element would also be appreciated. I've been looking at the Diamond antenna elements but they must be gold plated because they are spendy. And for GPS, the Garmin GPSMAP 76 would be good for me. I like how you can load different maps (cartography, street maps, etc) and even marine maps which would be good for boating plus it's portable for when I get a TH-D7AG (maybe the Easter bunny will look capriciously towards me one this one). Sorry I'm so long winded on this e-mail, I'm still coming down from my coffee high from Saturday. Thanks again!

I stopped buying 73's several years ago. A good friend of mine was on HF one night and Wayne (or someone signing his callsign) was very insistant on knowing about my friend's restrooms in school. Did the boys have separate ones or did the girls go to the same, how close were they, and as I recall they got worse. Unfortunatly I don't remember the details, but it was kind of gross.

You'll love the TM-D700A. Not a better APRS mobile radio to be had. It's little cousin the TH-D7A is great for a portable too. These admissions are very difficult for a former "If it ain't Yaesu it ain't squat" person, but you'll notice I still avoid using the "K" word! You won't be sorry for buying either of them.
Everyone has their own preference on antennas. I prefer Larsen Mobile antennas as they are commercial quality and use the NMO mount which I prefer. Don't scrimp on price on your antenna as it is just as important as your radio for getting the signal out. I would also suggest avoiding the extremely long 'high gain' mobile antennas as they tend to be a nuisance to live with and offer little to no performance gain over 'standard' length antennas. You only need to get to the digis or repeater most of the time so hi gain antennas are not necessary. The Larsen 2/70 NMO is a great antenna to do with in my opinion.

From: verhap@occ1.sd01.k12.id.us
Topic: 1595 Message: 1595

I only have homework from Stephanie. Where's everyone elses?

For the class, you'll need a BS2, perferrably the BS2p. You'll also need a programming board. There is a Super Carrier Board that will get you started, and is cheap ($49). You can also use the BOE and get a bread board, wires, and wall wart. It costs $109.

I'll bring LEDs and resistors to the next class. You won't have to purchase those.

Okay I'll send you the homework shortly.

During the time your email was faulty I sent you a question that didn't get answered yet. Here it is again.

What happens to the comments in a BASIC stamp program? For our homework you asked us to add comments. Do these comments use up memory? I'm assuming that they are not sent to the BASIC stamp because you can't retrieve them anyway. They probably stay in the editor only.

Jeff

Correct. They only stay in the file you create when you write a
program. The basic commands are tokenized and sent via a serial
connection to the stamp. There is an ATN line that gets either
pulled high or low to stop the stamp and lets the program get
loaded into EEPROM.

Another thought. If you knew how to tokenize basic coammnds (PBASIC to be painfully specific), you could have one stamp program another.

Hi all,

I upgraded my APRS software to 2.01. Every once in a while I hear the letter D in morse code from the speaker. What does it mean? Can I turn it off?

Hmmm. Sounds like you need to see a doctor!
Seriously, you can go into the settings menu and turn the CW off. This new version has a number of CW symbols that will be sent for different events and they got on my nerves also. Go to Setup-Settings-Sounds and you'll see where to turn them off.
